Prepared by Apex Link Groups

Shareholder Portal Web Application Proposal

Functional scope and detailed desktop and mobile interface concepts

Prepared for: **NIA Group of company**
Proposal reference: ALG-SP-2026-16
Date: 04 November 2026
Version: 1.0 | Client discussion draft

We propose a secure web application that gives every shareholder a private, clear view of their holdings while authorised company staff maintain the underlying share register and published values.

This proposal describes the recommended scope, user journeys, permission controls, data rules, delivery approach and interface designs. It is intended to support scope agreement before implementation and commercial confirmation.

All names, records, figures and company branding inside the interface concepts are illustrative. The interfaces are design mockups, not screenshots of a completed application. The final portal will use the client company's identity.

Developer name follows the supplied logo: Apex Software Solutions. Legal contracting name and contact details are to be confirmed before issue for signature.

Proposal guide

The document moves from the business purpose to detailed screen concepts, then defines the controls and delivery terms needed to build the application consistently.

Part	What the client can review
Business scope	Purpose, assumptions, feature boundaries and sample calculations
Desktop interfaces	21 detailed screens across shareholder and administration workspaces
Mobile interfaces	8 responsive screens covering everyday access, entry and approval
Controls and delivery	Permissions, data rules, security, testing, schedule and handover
Commercial discussion	Unpriced cost schedule, responsibilities and scope confirmation

How to read the mockups

Each desktop screen is followed by an explanation and a practical example. Mobile screens use the same records and design language. Controls shown represent the proposed experience; exact field wording and interactions will be finalised during design review.

Recommended starting scope

One client company, one base currency and one ordinary share class. The data structure should retain company and share-class identifiers so later extensions are possible. Multiple companies, currencies or share classes require a confirmed change to scope.

Decisions still needed

Client legal name and branding; shareholder count; source spreadsheets and historical coverage; share valuation method; approved business rules; language requirements; hosting preference; responsible approvers; budget and support arrangements.

Business purpose and proposed scope

The company currently relies on staff to update share information manually. We will provide one controlled register and a private portal, reducing repeated requests for balances and helping shareholders understand the records behind their holdings.

Shareholder experience

A shareholder signs in, sees their published balance, ownership percentage, applicable value per share and calculated holding value, and can inspect history, download permitted documents and contact the company. Other shareholders' personal information is not exposed.

Company operations

Administrators manage people and access. Data officers prepare share movements and valuation updates. Approvers review the impact and evidence before publication. The portal displays only effective, published information.

Included in proposed core scope	Optional extension subject to agreement
Private accounts and password recovery	Dividend declarations and payment tracking
Share register and manual value updates	External price feeds or accounting integrations
Approval workflow and audit history	Multiple companies, currencies or share classes
Responsive dashboards and graphs	Native Android or iOS applications
PDF statements and authorised CSV exports	Email or SMS notification integrations
Documents, in-app notices and basic support requests	Online share trading, payments or e-signatures

The portal records and communicates company-approved information. Trading, payment processing, return guarantees and valuation advice are outside the proposed core scope. Exact company valuation and share rights are defined by the client.

Share data and worked examples

Different figures must remain clearly separated so shareholders can understand what each number means. The same sample dataset is used throughout the interface concepts.

Field	Illustrative value	Meaning
Issued ordinary shares	1,000,000	Company shares included in the ownership denominator
SH-001 holding	12,500	10,000 opening shares plus 2,500 allocated shares
SH-002 holding	20,000	Balance before the proposed transfer
Published value per share	LKR 125.00	Effective 01 Nov 2026
SH-001 ownership	1.25%	12,500 / 1,000,000 × 100
SH-001 holding value	LKR 1,562,500	12,500 × 125.00

Company value and holding value

An indicative value of all issued ordinary shares would be LKR 125,000,000 using the sample figures. This calculated total is not automatically the company’s enterprise value, audited valuation or a guaranteed selling price. Any separately approved company valuation must have its own label, date and basis.

Historical comparisons

Sample monthly values are LKR 100, 106, 103, 112, 108 and 125 from June to November. The graph uses effective published points and step changes, without implying continuous market trading. The October to November change is (125 - 108) / 108 × 100 = 15.74%.

Personal history

Historical holding value uses the shares held at each date multiplied by the value applicable at that date. Changes in allocations must not be presented as investment profit. No percentage change is displayed when a valid comparison value is absent or zero.

Interface design and navigation

The proposed portal uses a navy navigation area, blue actions, a light workspace and restrained gold accents derived from the developer's supplied identity. The client's logo and name will replace the sample company label inside the product.

Desktop layout

A persistent sidebar groups the main areas. The top bar identifies the company and current user. Page titles explain the task; summary figures appear above charts and supporting tables. Important actions use consistent wording such as Save draft, Submit for approval and Approve and schedule.

Responsive behaviour

On narrow screens, navigation becomes a menu and the shareholder's main destinations remain easy to reach. Summary cards stack vertically; register rows become labelled records or controlled horizontal tables. Forms use one column and reviews retain both current and proposed values. Administrative actions remain available on mobile according to permission.

Readability and accessibility

Charts display dates, units and a tabular alternative. Status is communicated with words as well as colour. Forms use persistent labels, keyboard focus and inline error text. Touch targets are designed for comfortable mobile use. Dates, currency precision, timezone and supported browsers are agreed during design.

Account and data states

The design includes first sign-in, no holdings, empty search results, invalid input, loading, failed requests, session expiry, permission denial, stale edits and scheduled changes. Errors preserve entered information where safe and offer a clear retry or recovery action.

The following 21 desktop mockups describe the proposed complete core screen set. Additional confirmation dialogs and small variations will reuse these layouts rather than introduce inconsistent designs.

Desktop interface 01 Secure sign in

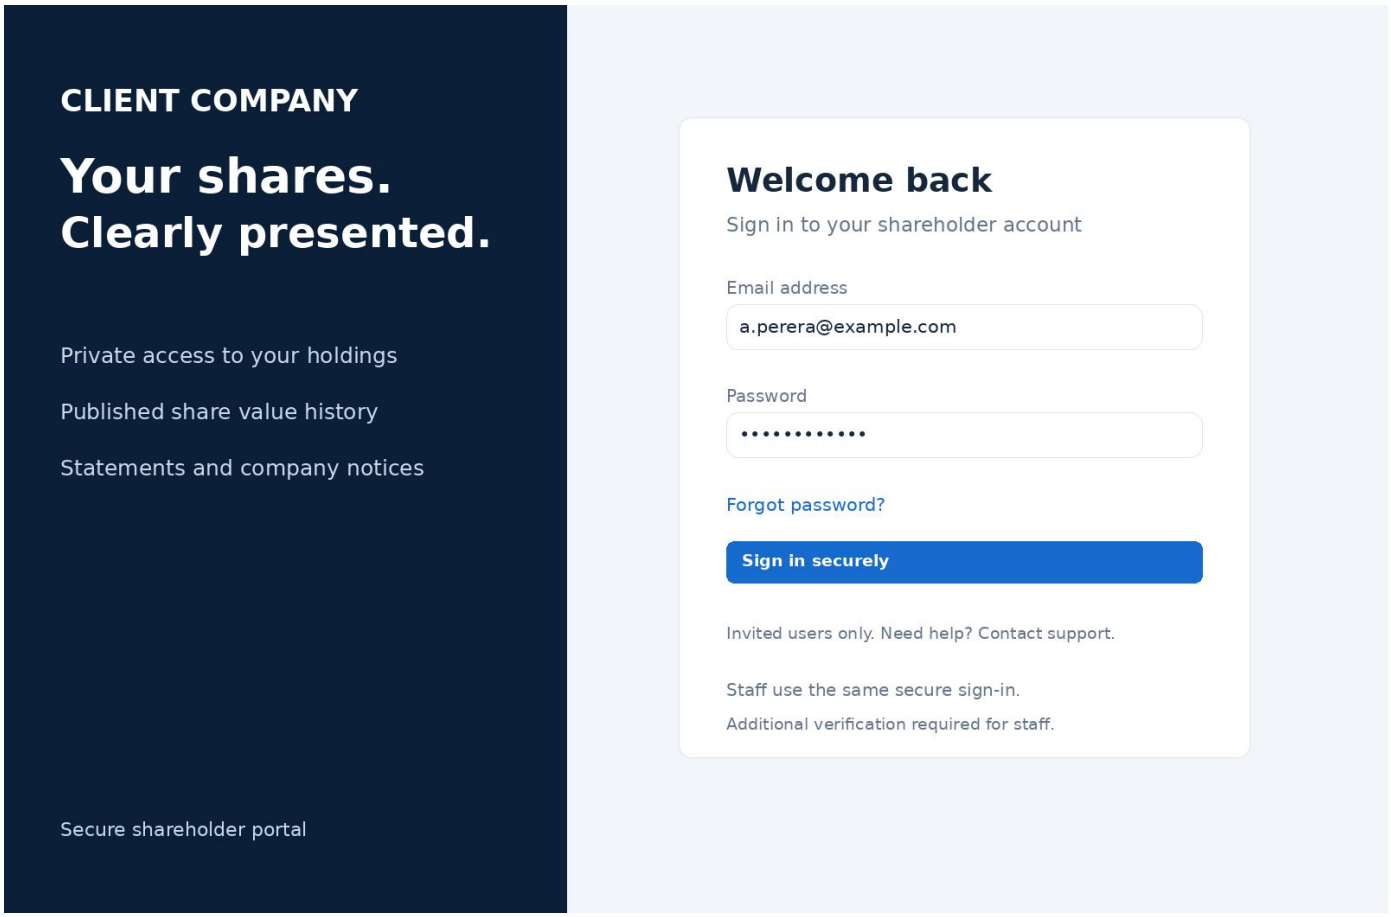

Figure D01 Proposed desktop interface with fictional sample data

Purpose and behaviour

A shared entry point routes each user to the correct workspace after authentication. Invitation activation, password reset, expired links and staff verification are part of the proposed access flow.

Example

Example: a shareholder signs in and sees only records linked to their shareholder ID. A staff account receives only its assigned permissions.

Desktop interface 02 Overview

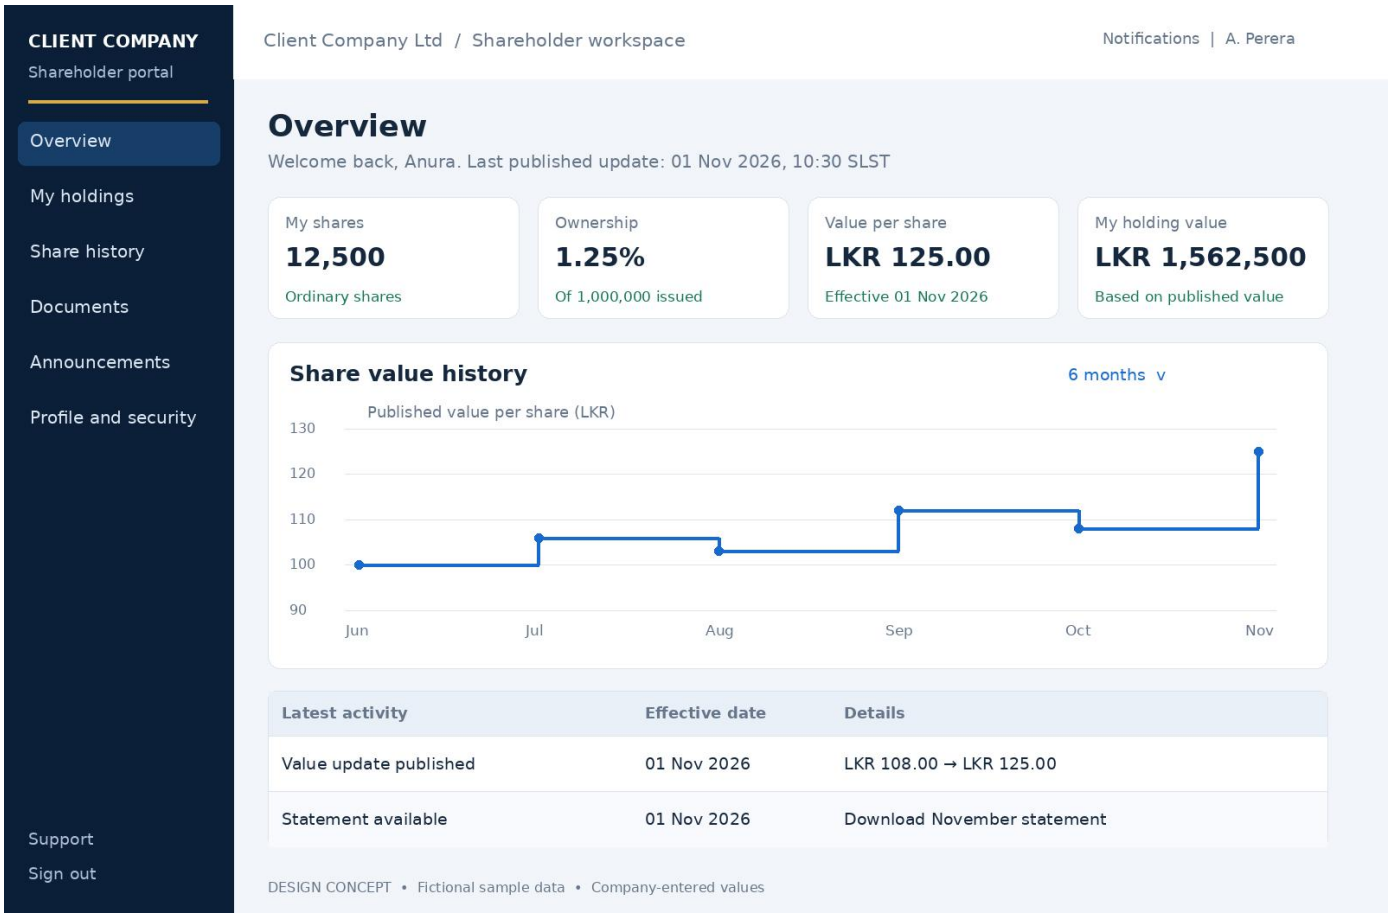

Figure D02 Proposed desktop interface with fictional sample data

Purpose and behaviour

The dashboard answers four questions immediately: how many shares are held, what percentage they represent, the latest company-entered value per share and the calculated holding value. A stepped chart reflects discrete published updates.

Example

Example: 12,500 shares × LKR 125.00 = LKR 1,562,500. Ownership is 12,500 ÷ 1,000,000 × 100 = 1.25%.

Desktop interface 03 My holdings

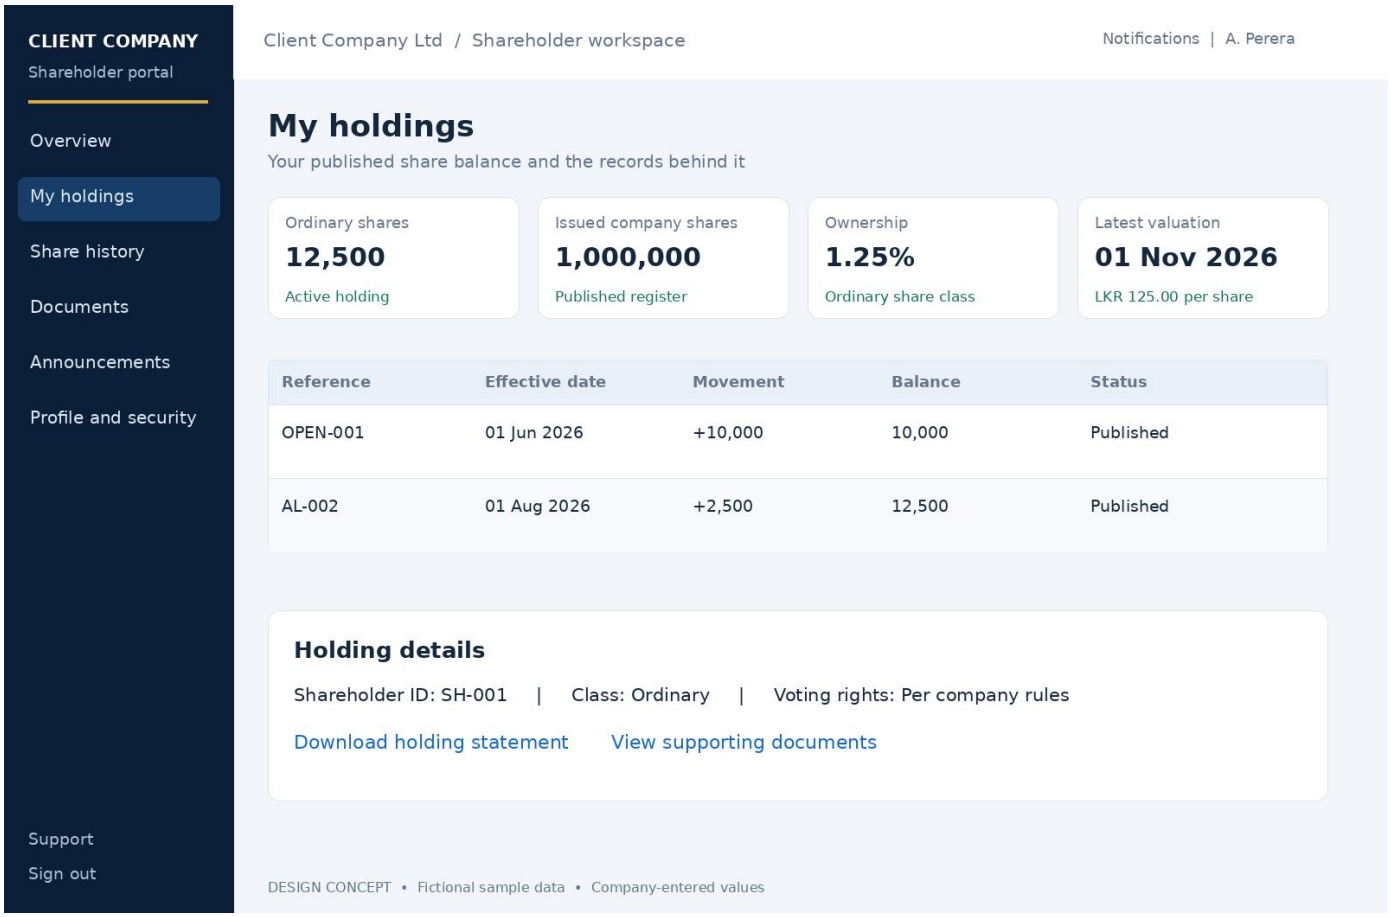

Figure D03 Proposed desktop interface with fictional sample data

Purpose and behaviour

A running ledger explains the balance. Each movement has a unique reference and effective date. Authorised transfers and corrections appear as linked records rather than silently replacing history.

Example

Example: an opening balance of 10,000 plus an allocation of 2,500 gives 12,500 shares. Supporting documents are visible only when explicitly assigned to this shareholder.

Desktop interface 04 Share history

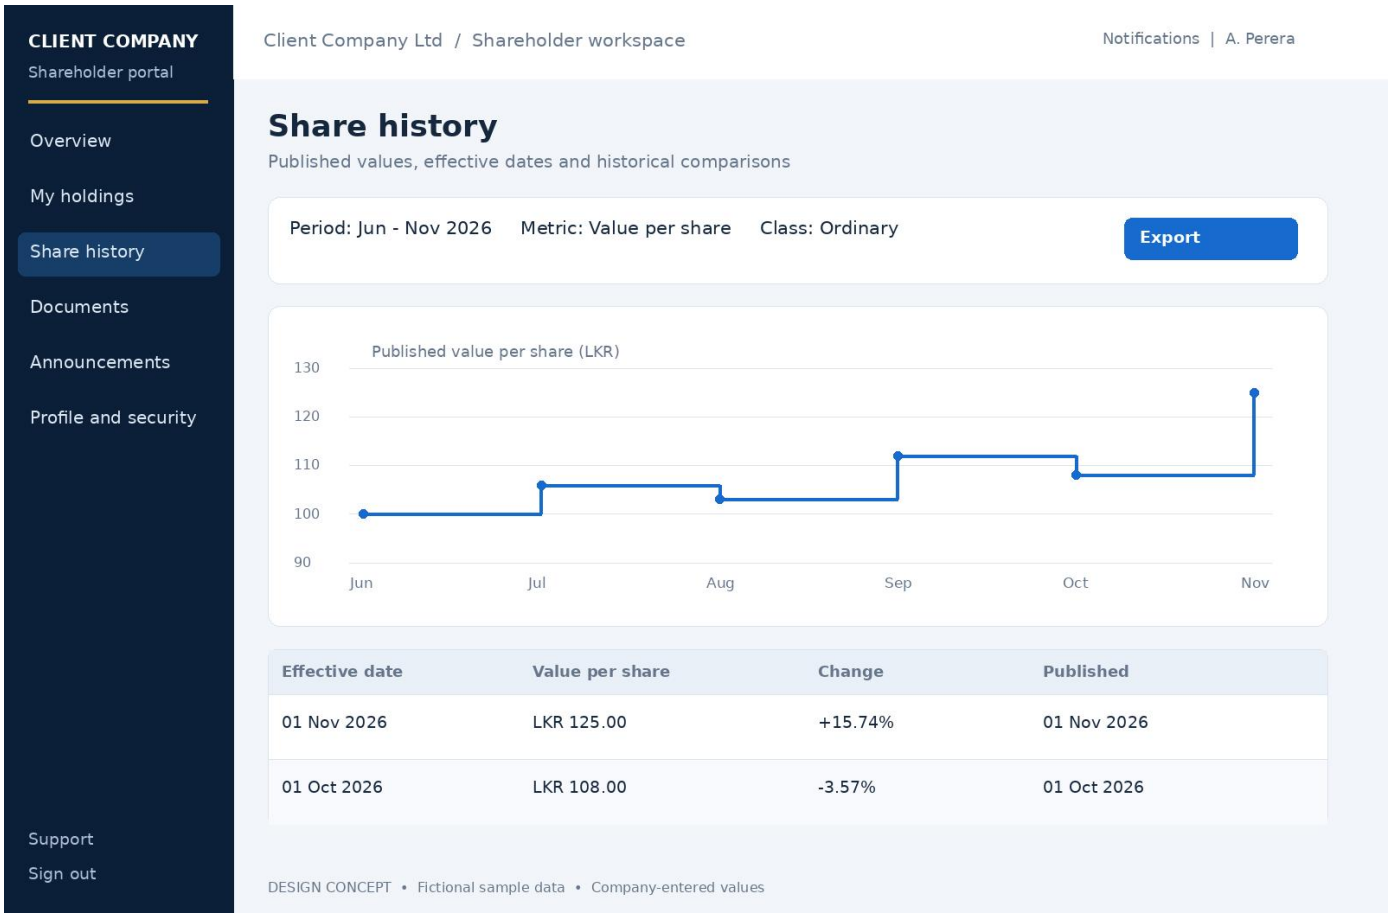

Figure D04 Proposed desktop interface with fictional sample data

Purpose and behaviour

Users can change the date range and inspect published values. Separate views distinguish the company value per share from personal holding value. No unpublished draft values appear in this view.

Example

Example: the latest value moved from LKR 108 to LKR 125, a 15.74% increase. This is a change in the recorded value, not a realised investment return.

Desktop interface 05 Documents

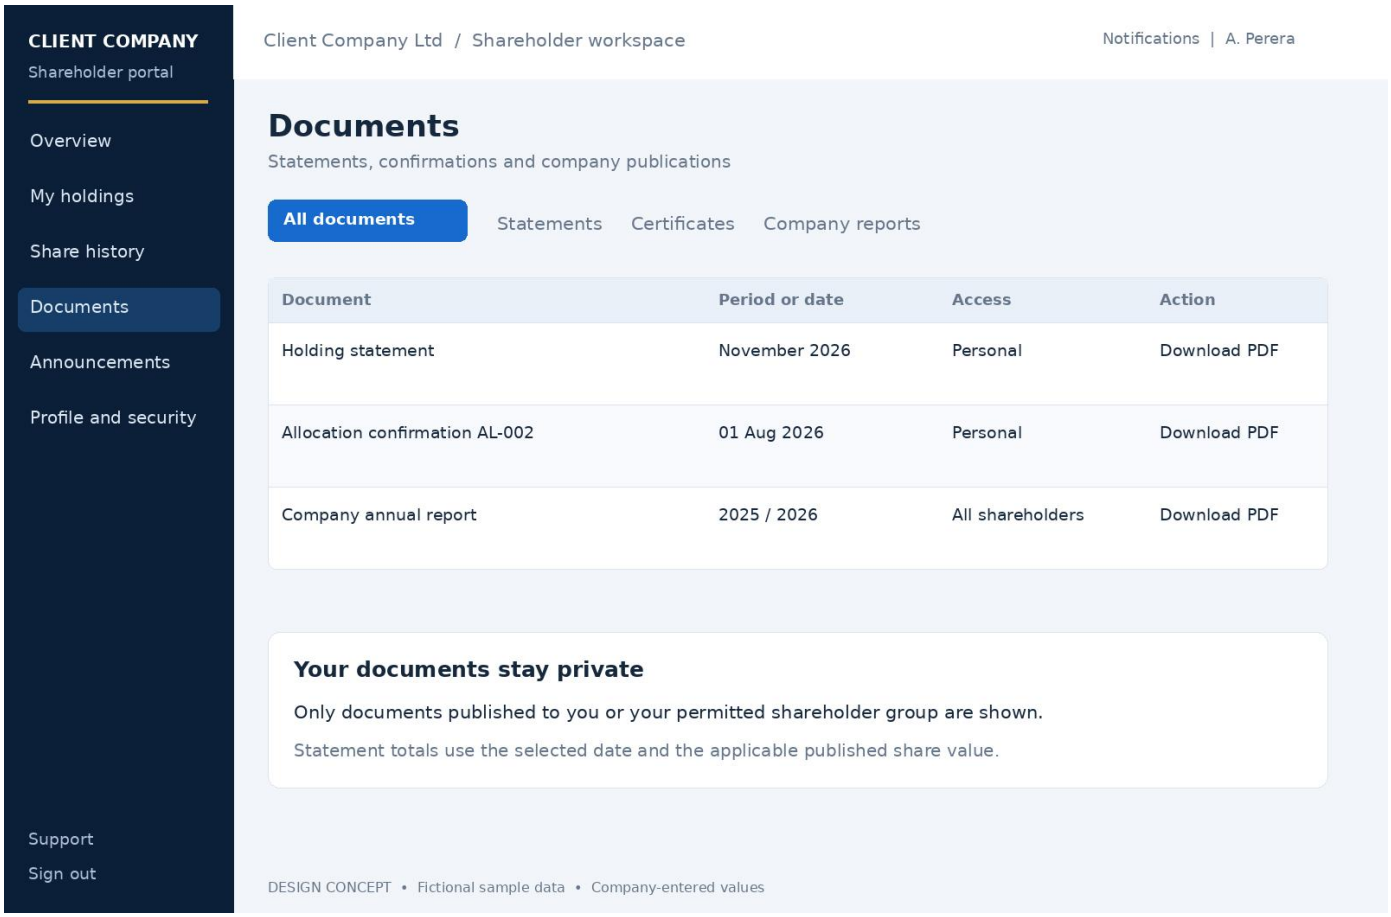

Figure D05 Proposed desktop interface with fictional sample data

Purpose and behaviour

Document categories, publication dates and download actions make records easy to find. Statements are generated from a dated snapshot so a later share update does not silently change an earlier statement.

Example

Example: the November statement shows 12,500 ordinary shares and LKR 125.00 per share as at 01 Nov 2026. A private allocation letter is not visible to other shareholders.

Desktop interface 06 Announcements

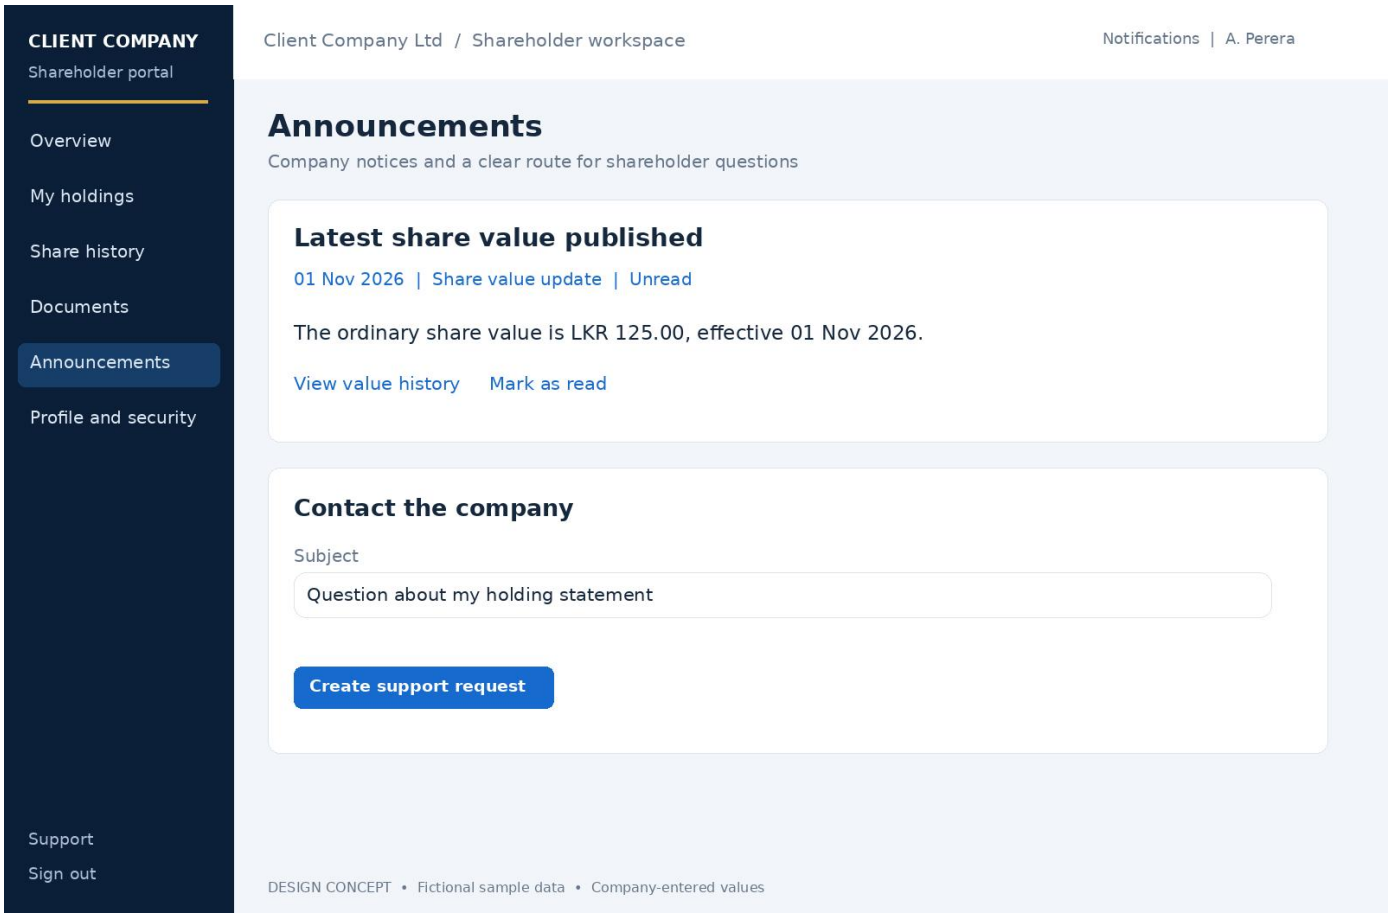

Figure D06 Proposed desktop interface with fictional sample data

Purpose and behaviour

Company announcements and in-app notifications are included in the proposed core scope. Support requests capture a subject and message and can be followed by reference number. Email alerts are an optional integration.

Example

Example: publishing a new value creates an in-app notice linking to the history view. A shareholder can raise a query without requesting changes directly to financial records.

Desktop interface 07 Profile and security

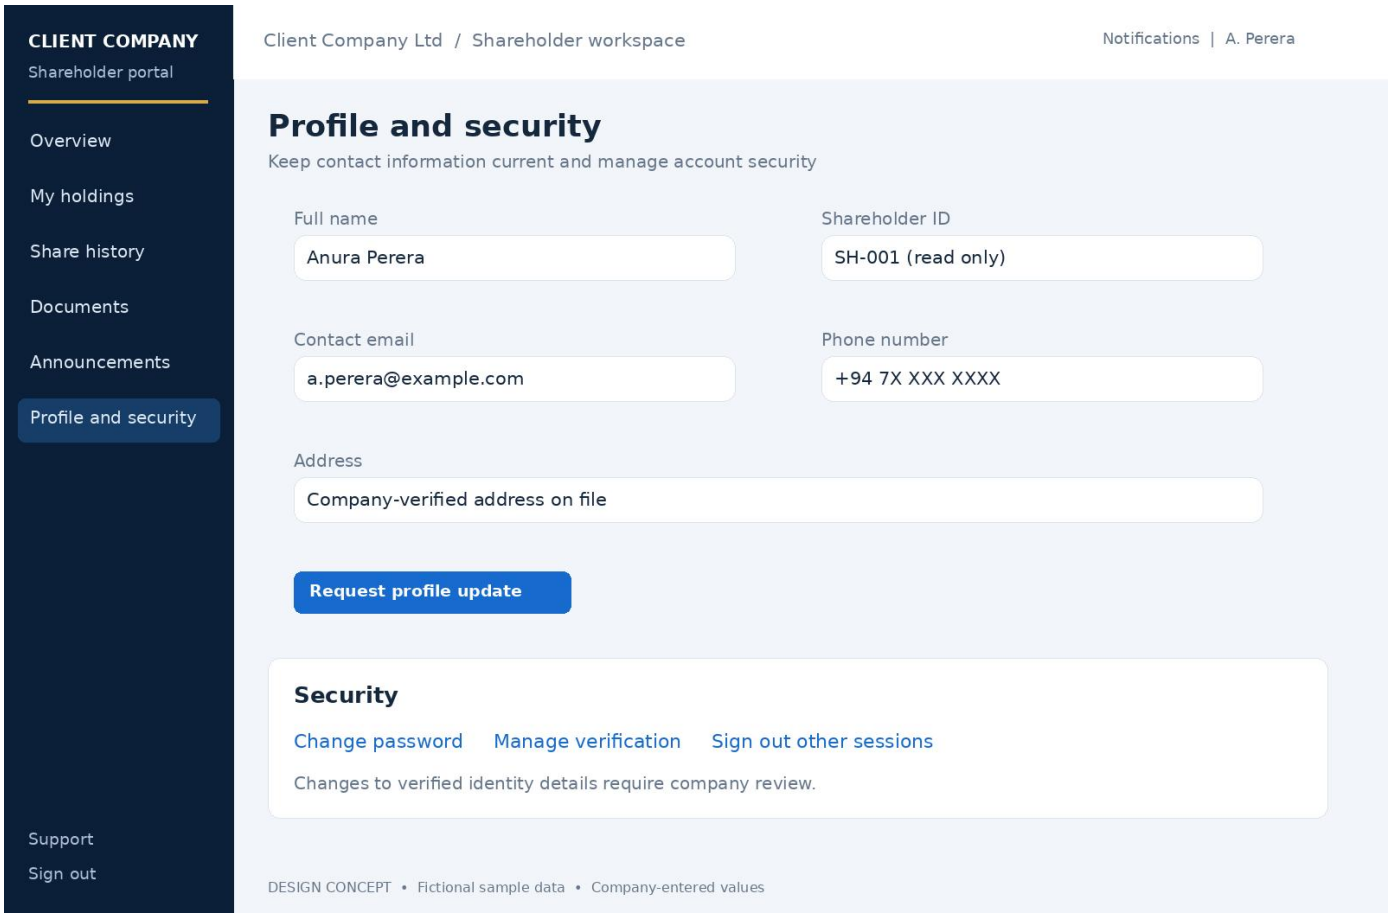

Figure D07 Proposed desktop interface with fictional sample data

Purpose and behaviour

Shareholders can manage passwords and sessions. Changes to sensitive identity or contact information follow verification and approval rules. Share quantity, ownership and share values cannot be edited by shareholders.

Example

Example: changing a registered email requires confirmation before it becomes the login address. An administrator can revoke sessions when an account is deactivated.

Desktop interface 08 Company overview

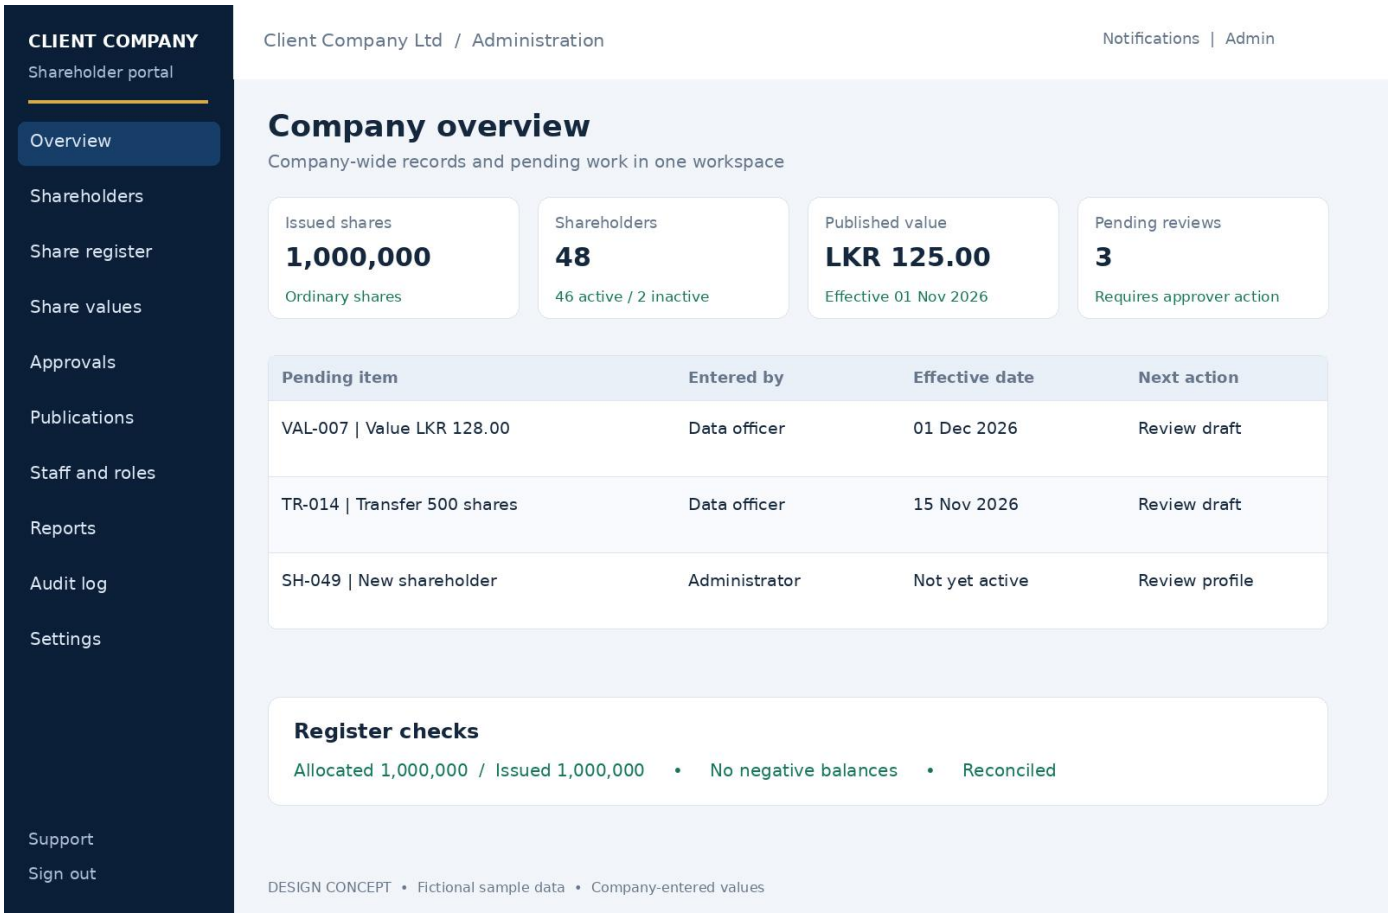

Figure D08 Proposed desktop interface with fictional sample data

Purpose and behaviour

The administration overview highlights share totals, active users, the latest published value and work awaiting review. A reconciliation indicator checks that holdings agree with the issued share register.

Example

Example: a draft December value of LKR 128 is visible to authorised staff but the shareholder portal still displays the published LKR 125.

Desktop interface 09 Shareholders

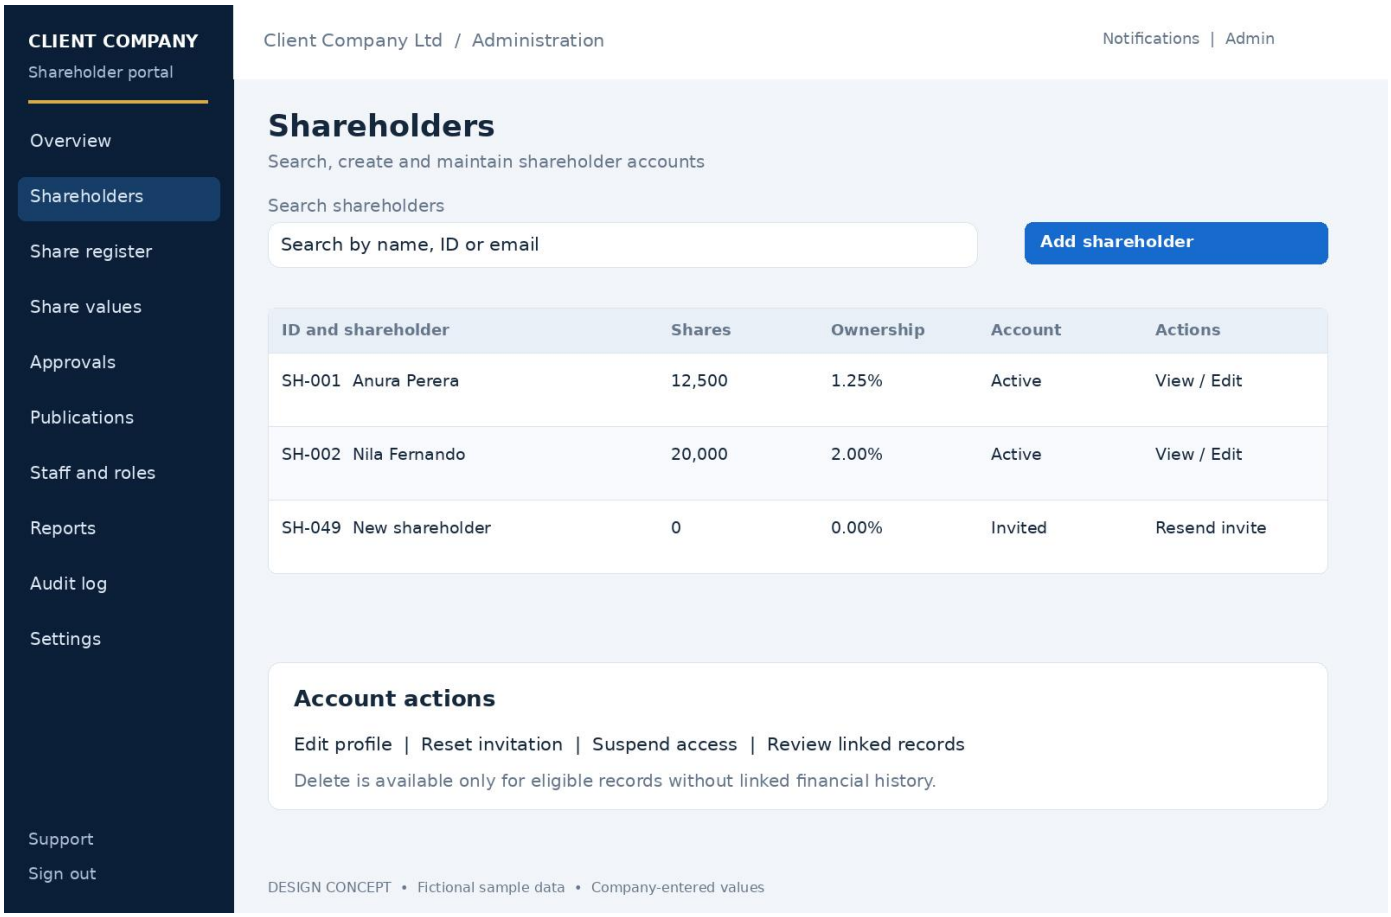

Figure D09 Proposed desktop interface with fictional sample data

Purpose and behaviour

Administrators manage shareholder identities separately from their financial ledger. Invitations provide account activation; passwords are never displayed to staff. Deactivation blocks access while preserving linked holdings and history.

Example

Example: a duplicate unused profile can be deleted after confirmation. A shareholder with published allocations is deactivated or merged through a controlled process, not removed with its ledger.

Validation and access: actions are shown only to permitted roles, with server-side permission checks. Required fields, date rules and concurrent changes are checked again when the record is saved or posted.

Desktop interface 10 Shareholders

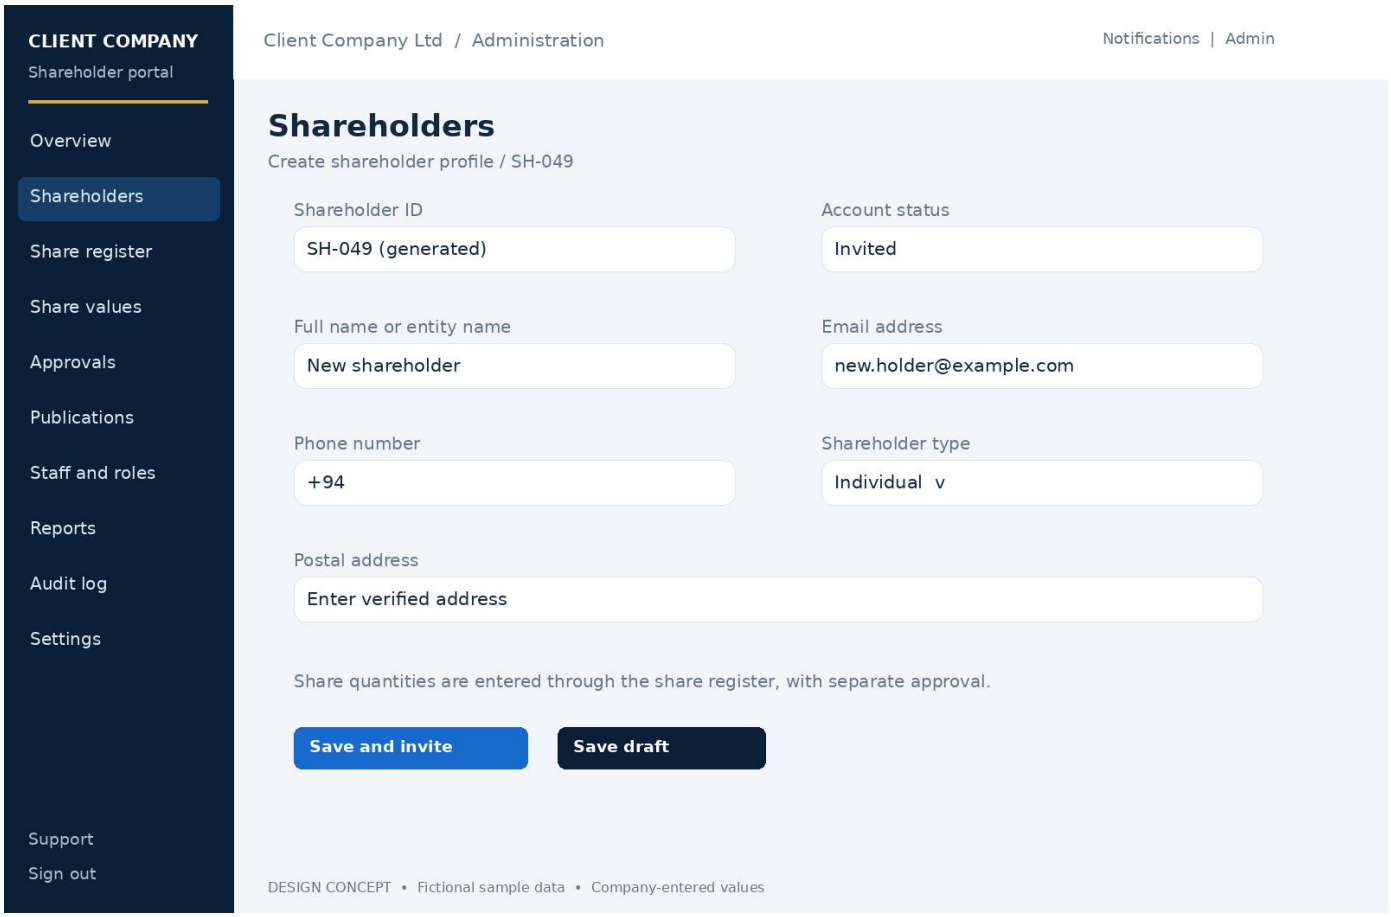

Figure D10 Proposed desktop interface with fictional sample data

Purpose and behaviour

The creation form captures verified identity and contact information, assigns a unique ID and sends an activation invitation when approved. Required fields, duplicate email checks and clear validation messages reduce entry errors.

Example

Example: saving a new shareholder does not automatically create shares. The authorised officer enters the allocation separately and submits it for review.

Desktop interface 11 Share register

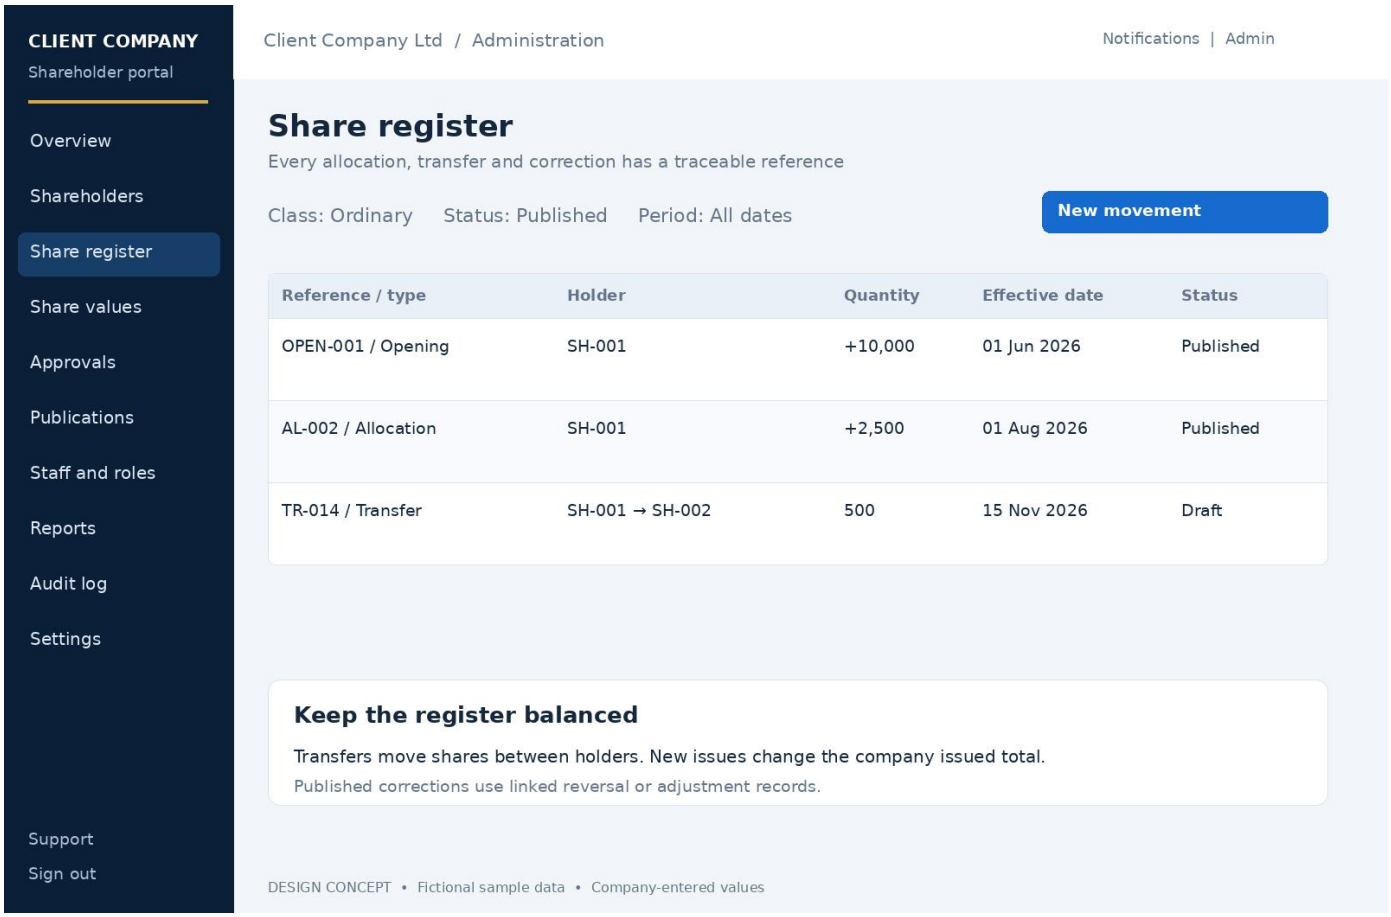

Figure D11 Proposed desktop interface with fictional sample data

Purpose and behaviour

The ledger supports opening balances, new issues, transfers and approved corrections. A transfer posts matched outgoing and incoming entries in one transaction. Published records are preserved; corrections are linked and auditable.

Example

Example: draft TR-014 would reduce SH-001 from 12,500 to 12,000 and increase SH-002 from 20,000 to 20,500. Issued shares remain 1,000,000.

Desktop interface 12 Share register

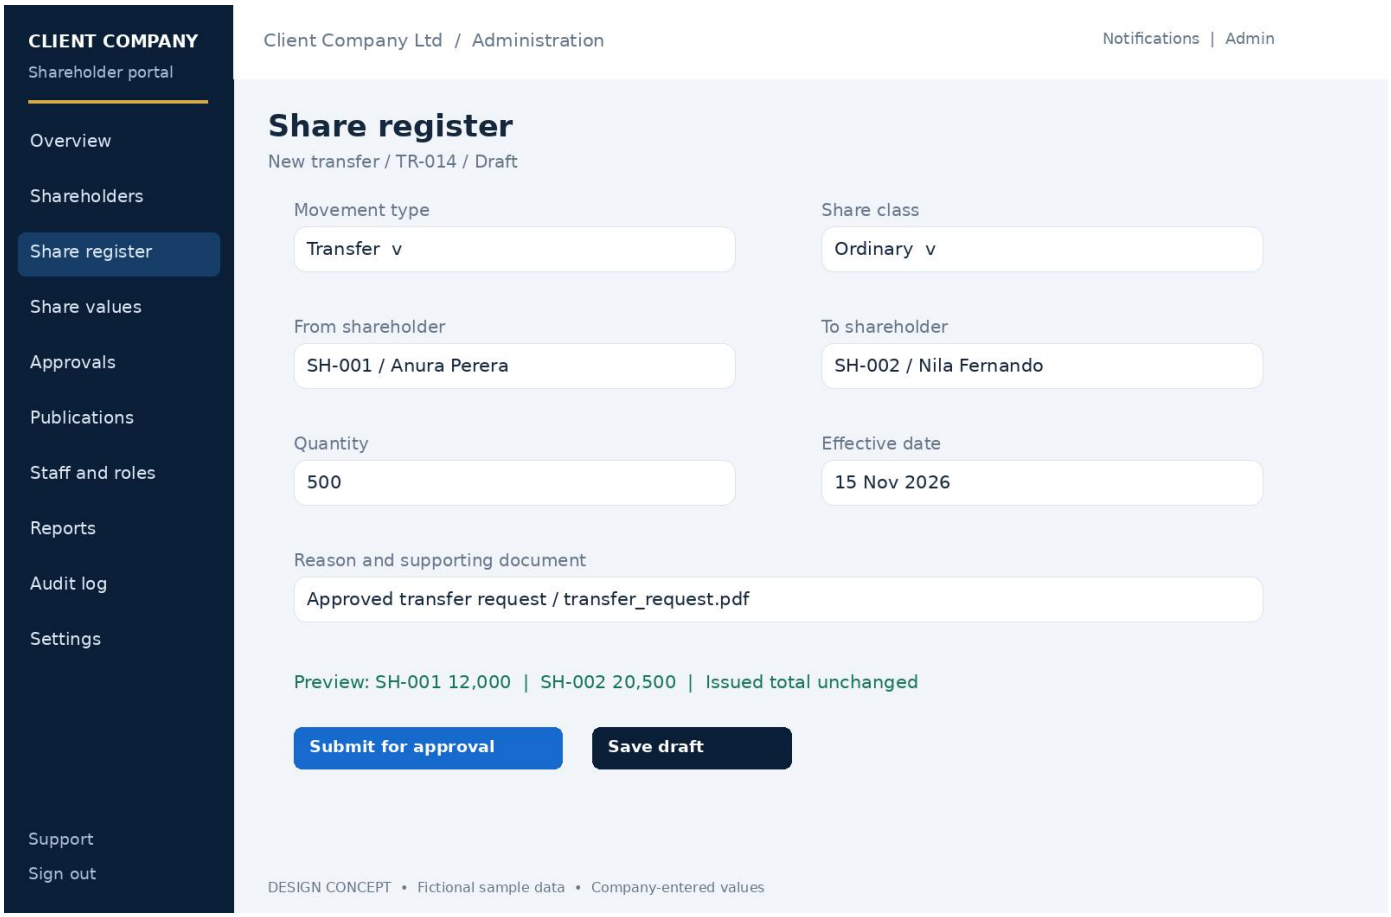

Figure D12 Proposed desktop interface with fictional sample data

Purpose and behaviour

The entry form shows the impact before submission. It checks sufficient balance, matching share class, valid dates and distinct source and recipient. New issues and adjustments use fields appropriate to their movement type.

Example

Example: entering 13,000 shares from a balance of 12,500 produces an error and cannot be submitted. A valid 500-share transfer remains invisible to shareholders until published.

Validation and access: actions are shown only to permitted roles, with server-side permission checks. Required fields, date rules and concurrent changes are checked again when the record is saved or posted.

Desktop interface 13 Share values

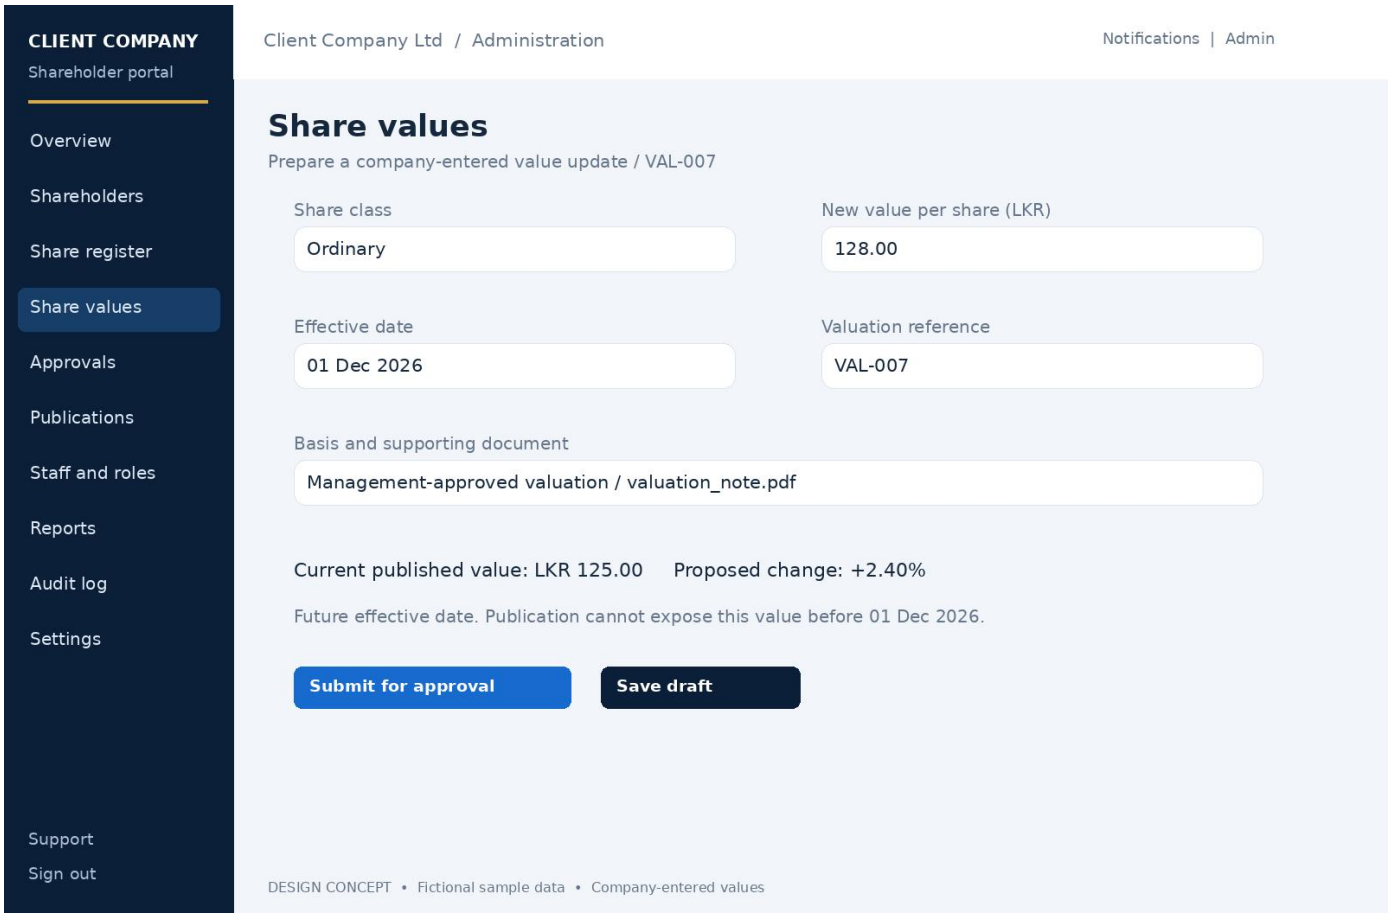

Figure D13 Proposed desktop interface with fictional sample data

Purpose and behaviour

Each value includes currency, share class, effective date, rationale and optional evidence. A new version is prepared and reviewed. Future-dated values remain scheduled until their effective time; the portal shows the latest effective published value.

Example

Example: LKR 128 on 01 Dec is a proposed future value. A shareholder viewing the portal on 04 Nov still sees LKR 125. No external stock price feed is assumed.

Validation and access: actions are shown only to permitted roles, with server-side permission checks. Required fields, date rules and concurrent changes are checked again when the record is saved or posted.

Desktop interface 14 Approvals

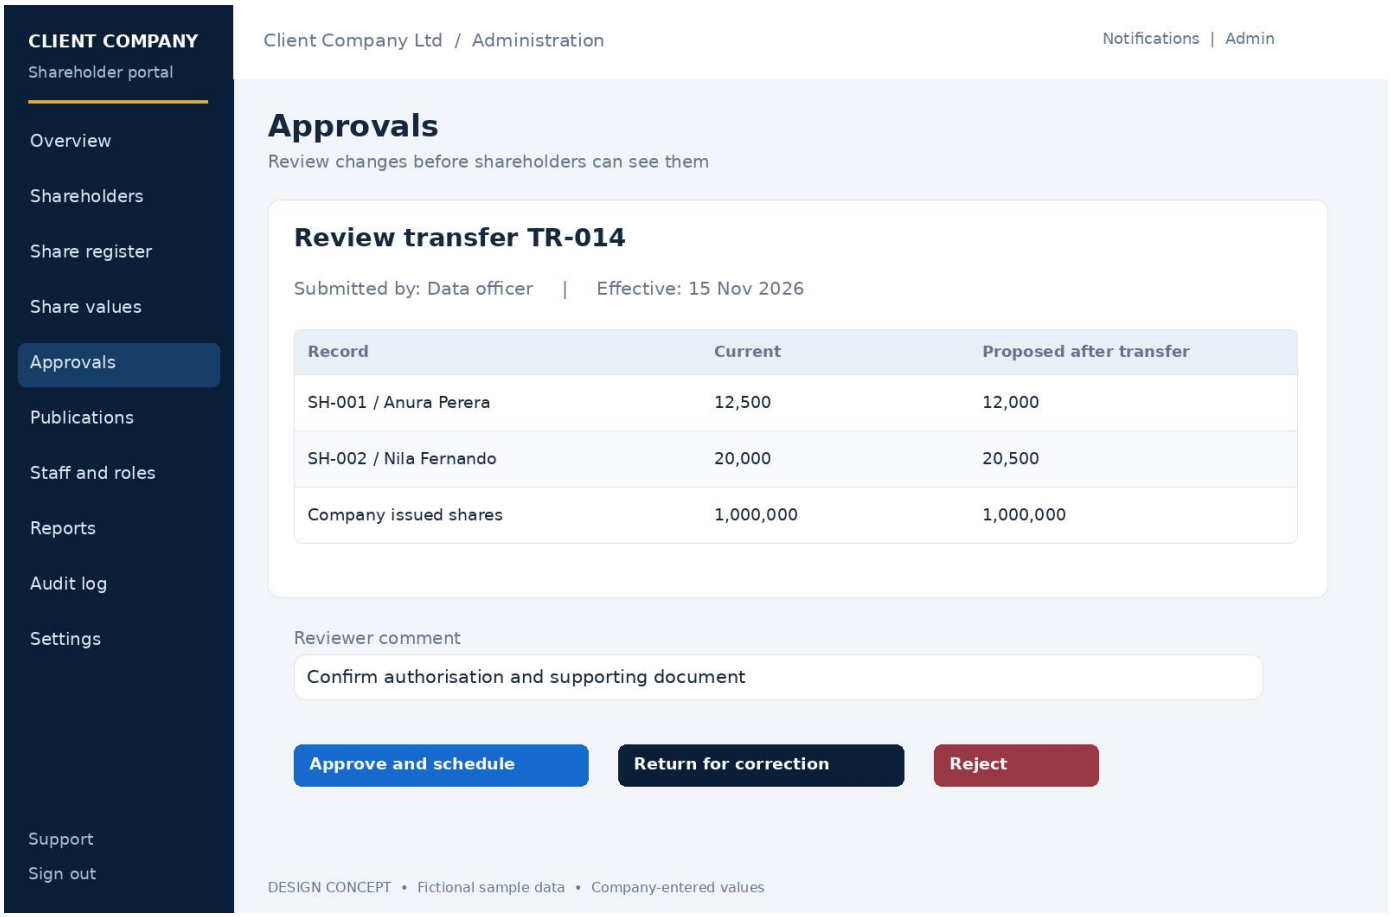

Figure D14 Proposed desktop interface with fictional sample data

Purpose and behaviour

The reviewer sees before-and-after values, supporting documents, effective date and the submitter. Self-approval is blocked under the recommended policy. Accepted future changes are scheduled and revalidated at posting time.

Example

Example: if another transaction reduces the source balance before 15 Nov, TR-014 must pass the balance check again. A failed check creates an exception for staff rather than a negative holding.

Validation and access: actions are shown only to permitted roles, with server-side permission checks. Required fields, date rules and concurrent changes are checked again when the record is saved or posted.

Desktop interface 15 Staff and roles

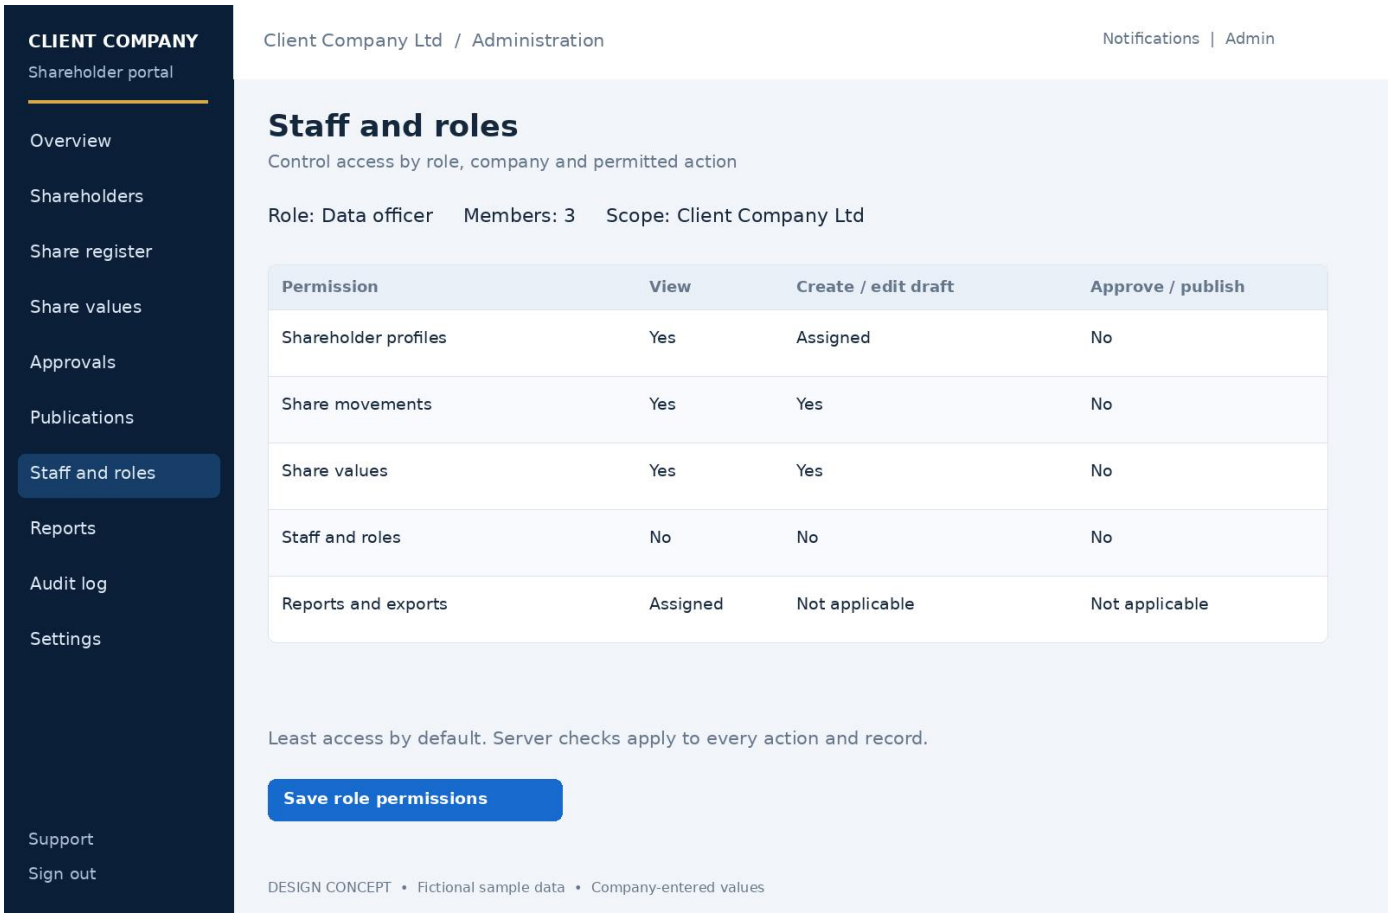

Figure D15 Proposed desktop interface with fictional sample data

Purpose and behaviour

Permissions distinguish reading, drafting, approving, publishing, exporting and account administration. The proposed roles are Administrator, Data officer, Approver and Shareholder. Exceptions are explicit and logged.

Example

Example: a data officer can prepare a valuation but cannot publish it, change staff permissions or view another company if multiple companies are introduced later.

Desktop interface 16 Reports

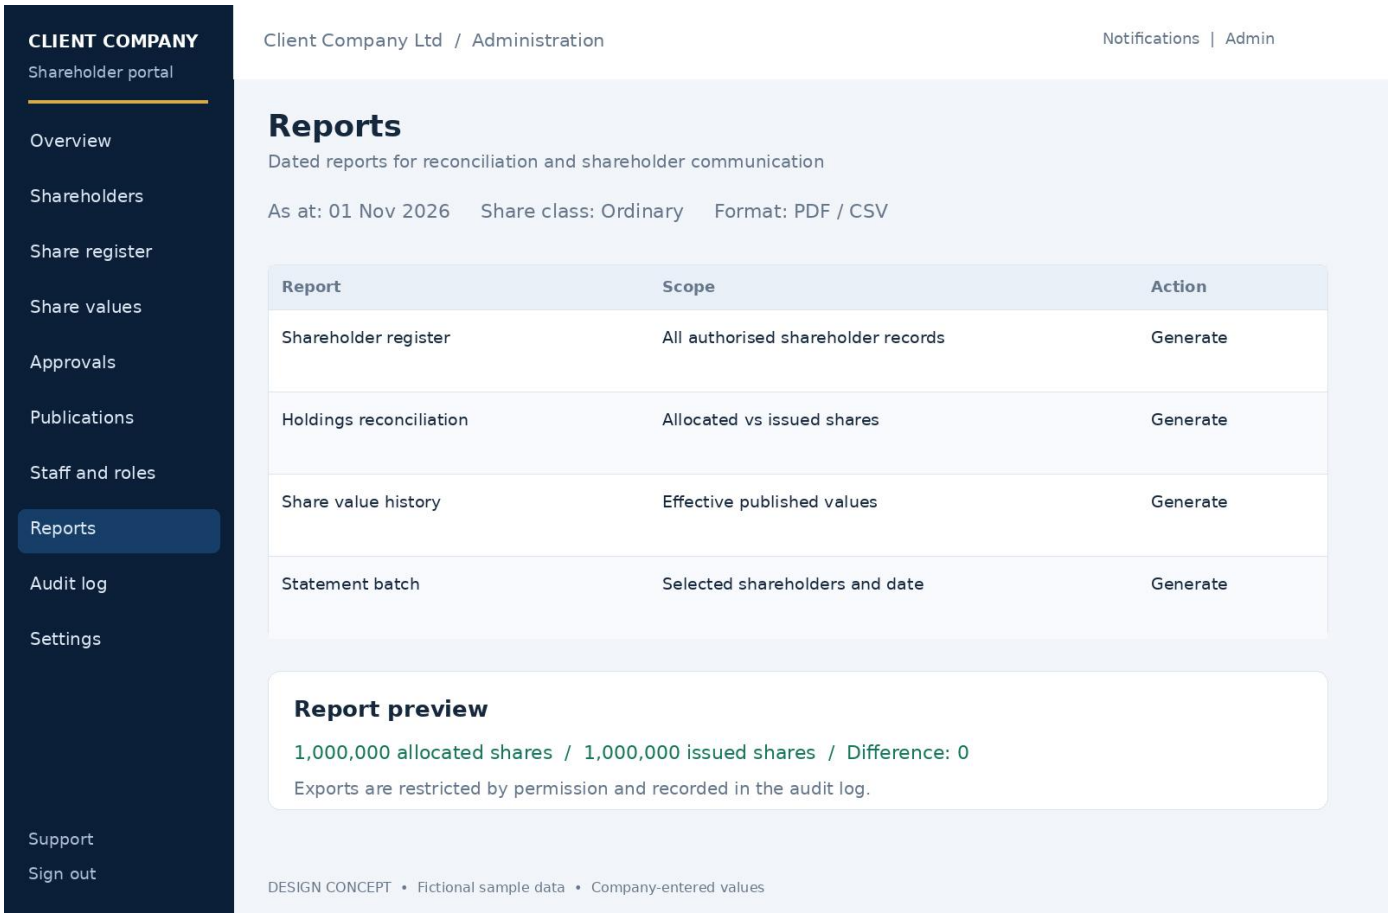

Figure D16 Proposed desktop interface with fictional sample data

Purpose and behaviour

Authorised users can generate shareholder registers, reconciliation summaries, value histories and dated holding statements. Export permissions are separate from screen access, and report generation is logged.

Example

Example: an administrator generates statements as at 01 Nov. Later transfers do not change the share balances used for that dated report.

Desktop interface 17 Audit log

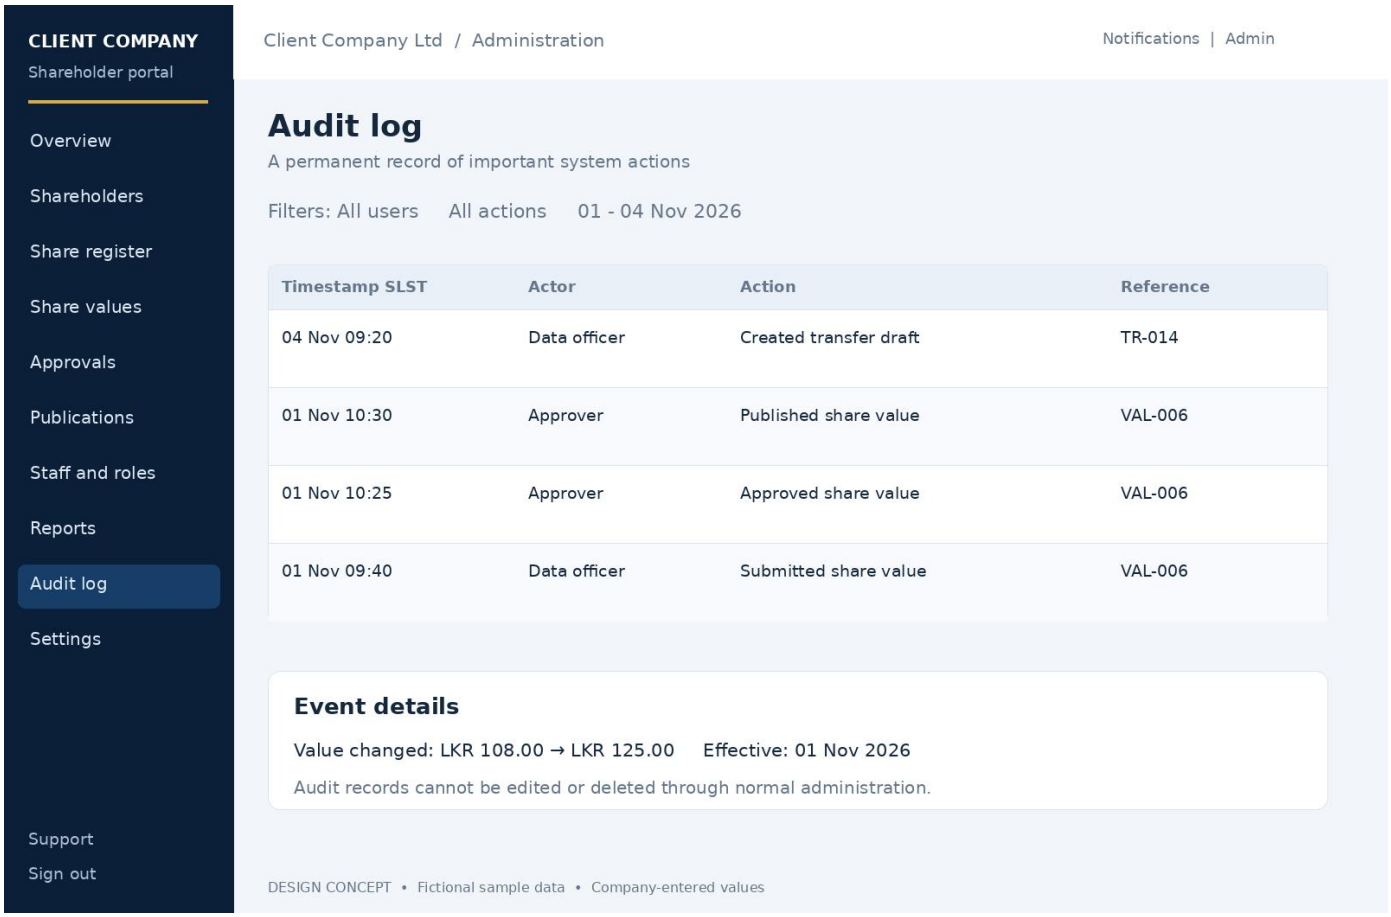

Figure D17 Proposed desktop interface with fictional sample data

Purpose and behaviour

Audit events retain the actor, time, action, affected record, previous value, new value and reason where applicable. Sensitive values such as passwords and verification codes are never logged.

Example

Example: a valuation can be traced from draft submission to approval and publication. A correction creates a new event and retains the earlier version.

Desktop interface 18 Publications

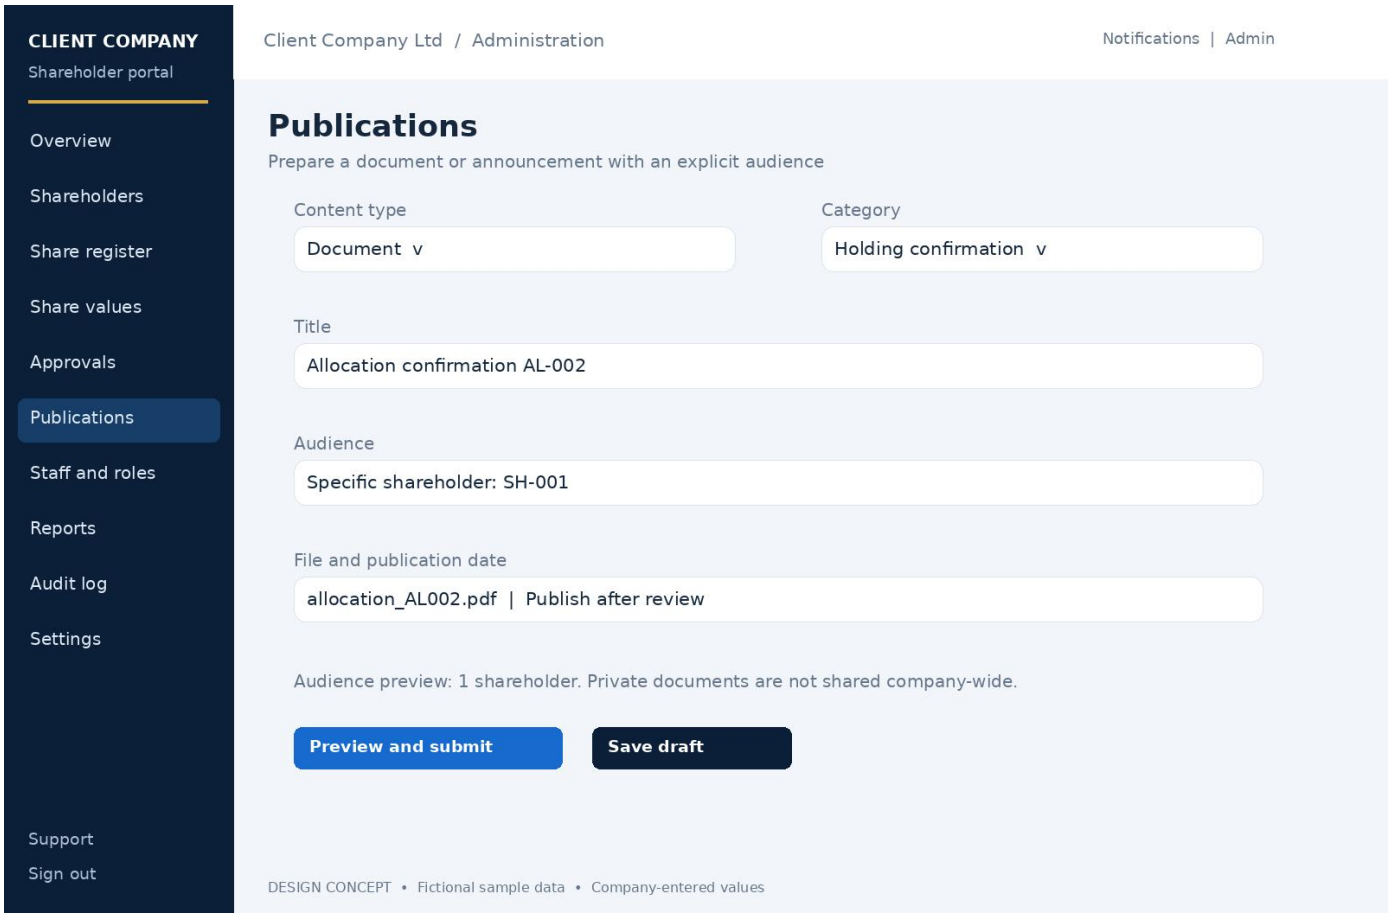

Figure D18 Proposed desktop interface with fictional sample data

Purpose and behaviour

Authorised staff create documents and announcements, choose a category and audience, preview the publication and submit it for review. The audience can be all shareholders or specifically selected recipients. Updating a file retains its version history.

Example

Example: an allocation confirmation is assigned only to SH-001. A company annual report can be published to all active shareholders. The preview shows the recipient count before publication.

Desktop interface 19 Staff and roles

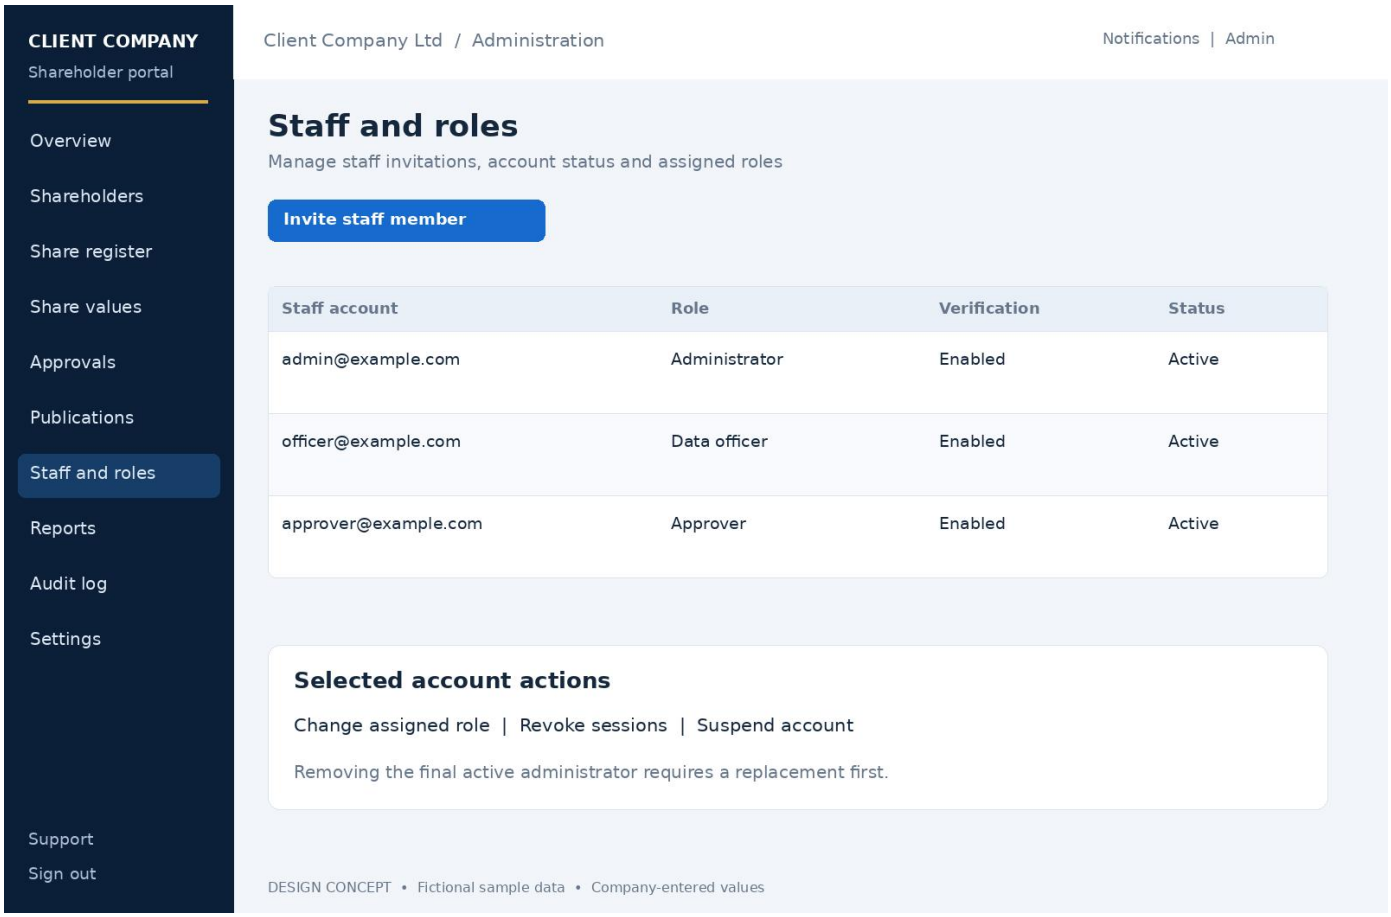

Figure D19 Proposed desktop interface with fictional sample data

Purpose and behaviour

Administrators invite staff, assign reviewed roles, suspend accounts and revoke sessions. Financial approvals are separately controlled. Role changes take effect through the access policy and generate audit events.

Example

Example: when a data officer leaves, the administrator suspends access and revokes sessions. Their earlier submissions remain attributed to the original account.

Desktop interface 20 Support requests

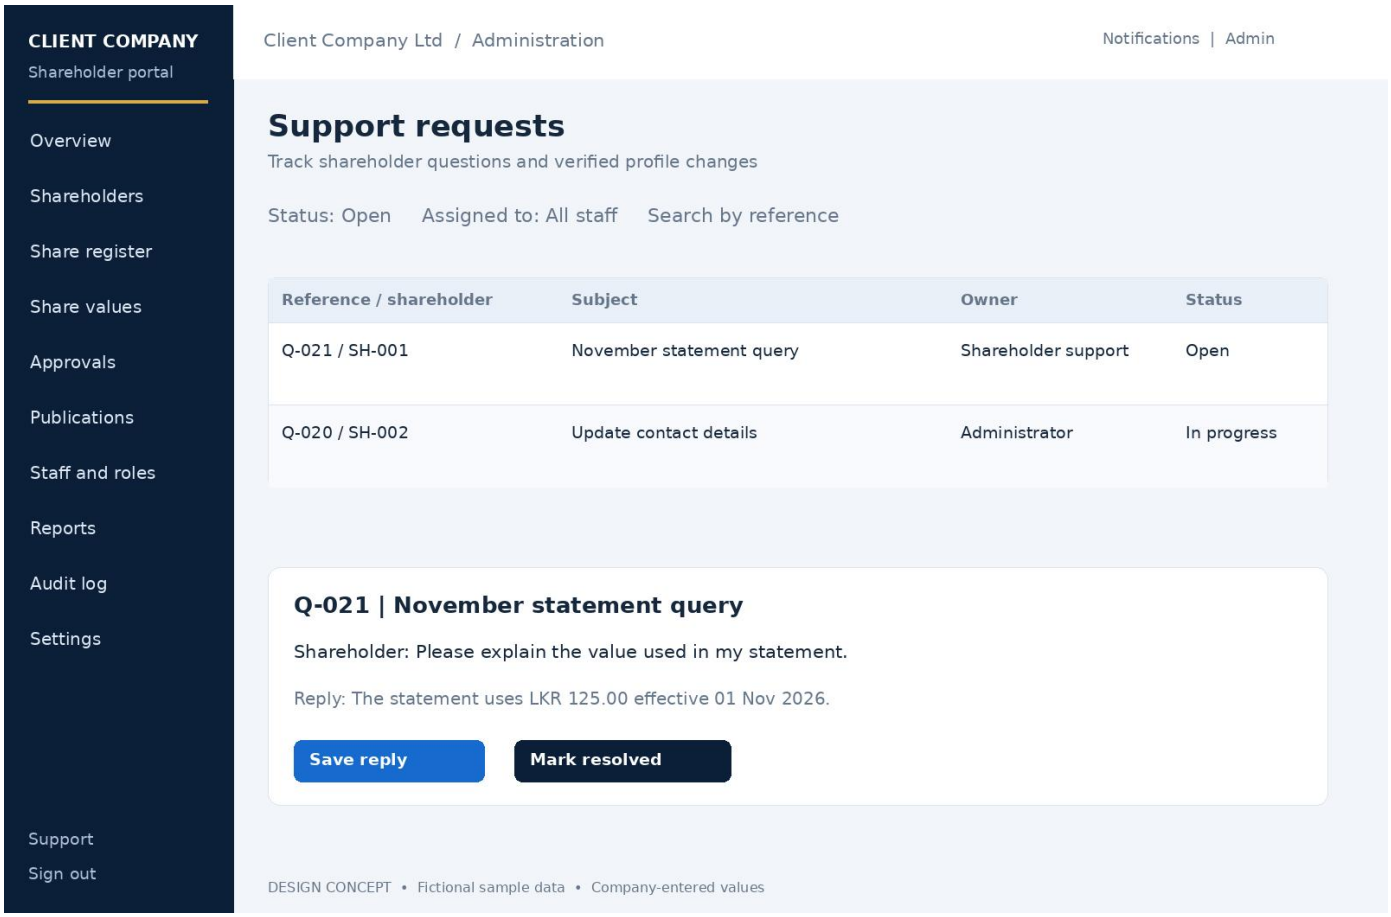

Figure D20 Proposed desktop interface with fictional sample data

Purpose and behaviour

Authorised staff review queries, assign an owner, respond within the portal and mark requests resolved. Access to conversations is restricted. A query does not itself authorise a change to shares or verified identity details.

Example

Example: staff explain the dated valuation behind a statement. If a correction is required, it proceeds through the normal share update and approval workflow.

Desktop interface 21 Settings

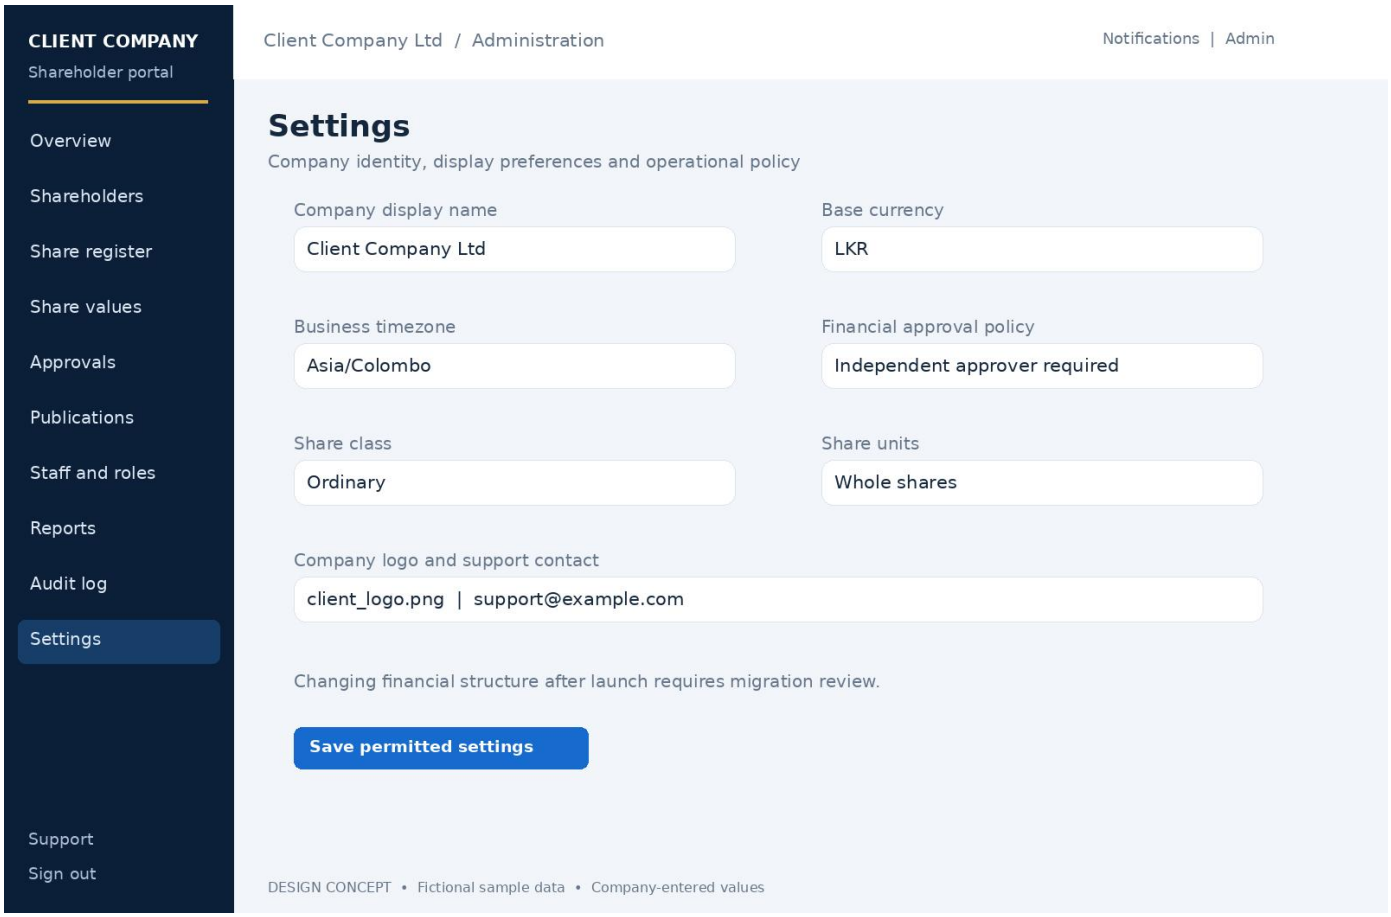

Figure D21 Proposed desktop interface with fictional sample data

Purpose and behaviour

Administrators maintain company identity and permitted preferences. Structural financial settings such as base currency, share classes or unit precision are controlled after launch because changing them can alter the meaning of historical records.

Example

Example: the client can update its support address without changing share balances. A currency change requires a separately reviewed migration rather than simply relabelling LKR values.

Mobile shareholder overview and history

Figure M01 Shareholder overview

Figure M02 Value history

Shareholders see the same published figures on a phone as on desktop. The overview prioritises balance and value; the history screen retains the date range, labelled values and access to underlying records.

Responsive website concept. No separate mobile application installation is required. All figures are illustrative.

Mobile documents and first use

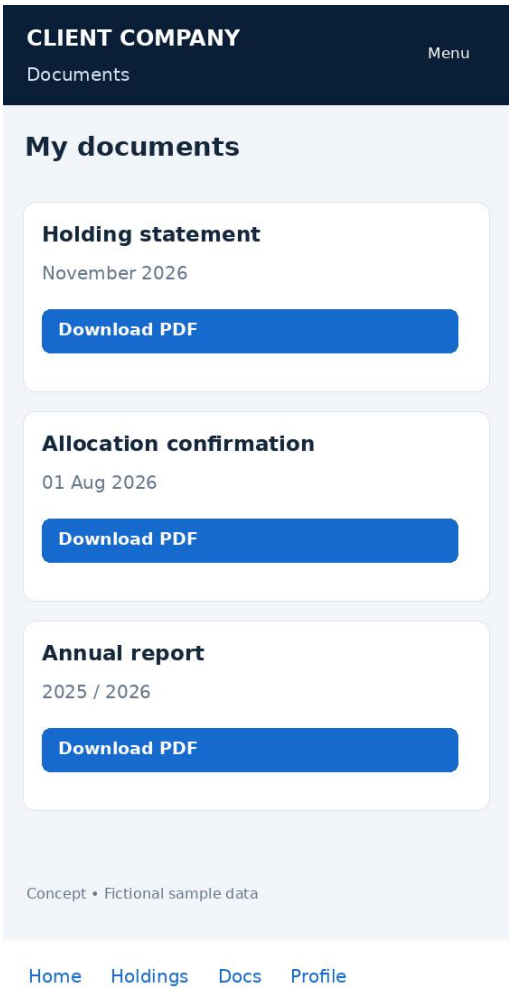

Figure M03 Documents

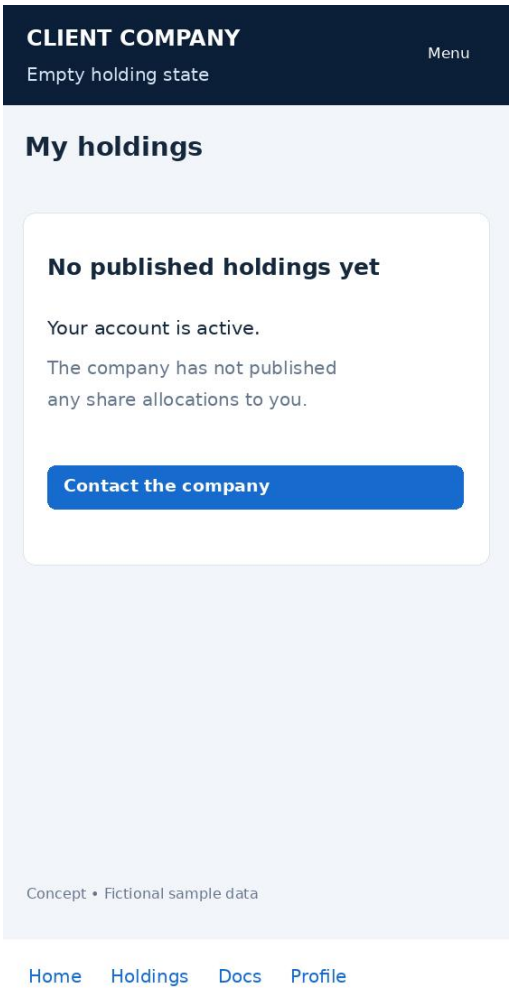

Figure M04 Empty holding state

Document cards replace wide desktop rows and provide clear download buttons. A shareholder with no allocations sees an honest empty state and support action rather than invented balances or misleading charts.

Responsive website concept. No separate mobile application installation is required. All figures are illustrative.

Mobile administration and share entry

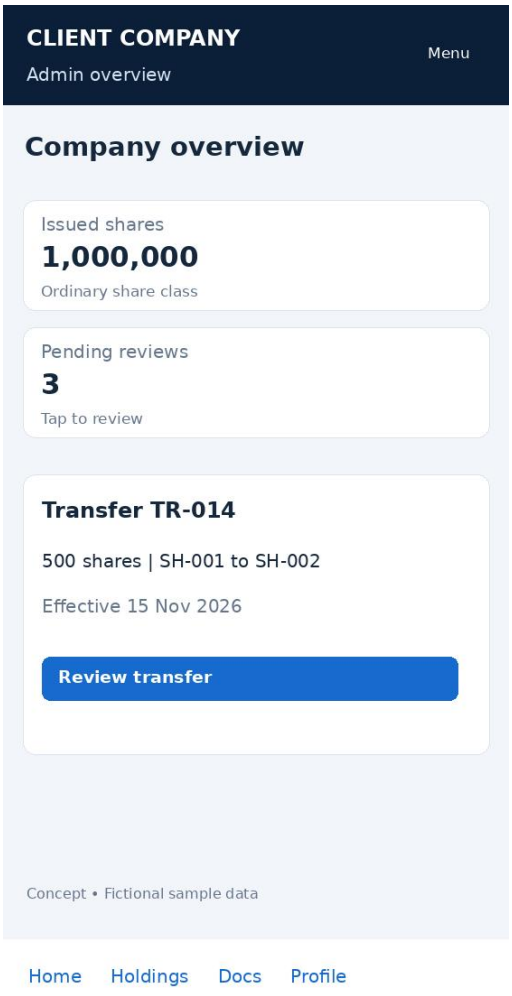

Figure M05 Admin overview

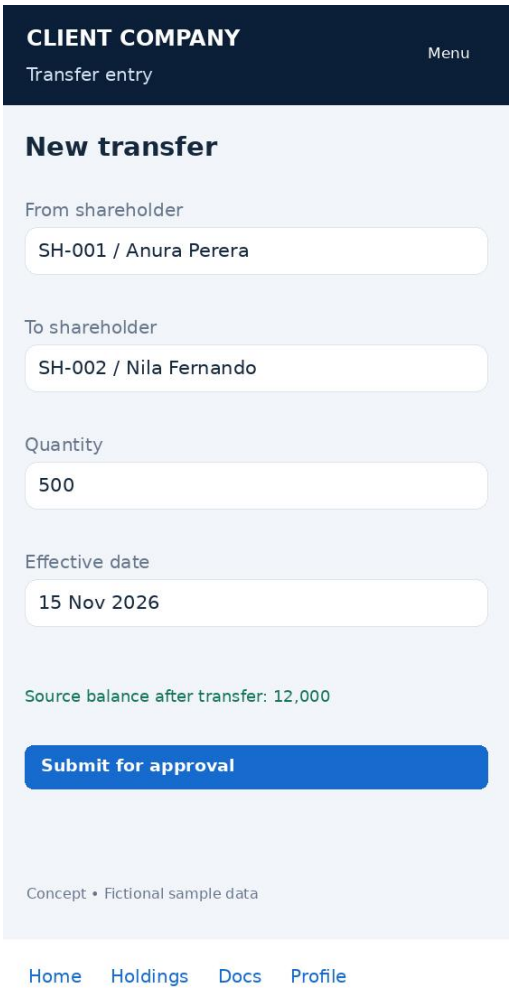

Figure M06 Transfer entry

Staff can review company totals and enter a transfer on a phone. Fields stack in one column and the resulting balance remains visible before submission. Larger imports and detailed reconciliation are easier on desktop.

Responsive website concept. No separate mobile application installation is required. All figures are illustrative.

Mobile approval and account verification

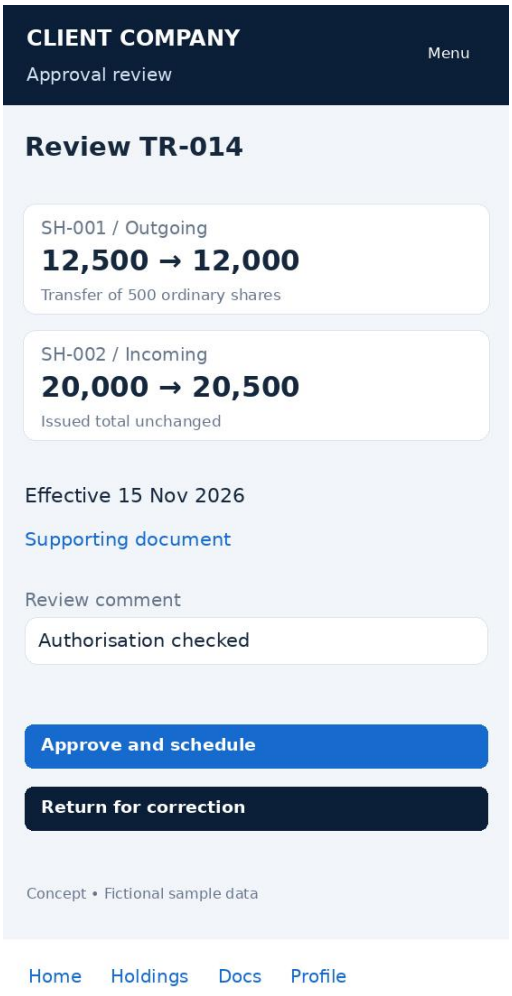

Figure M07 Approval review

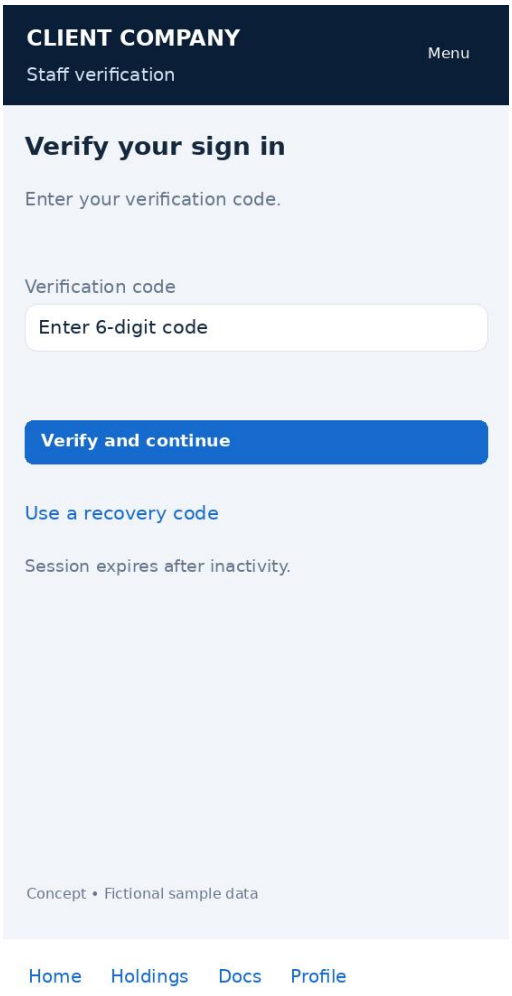

Figure M08 Staff verification

The mobile approval view preserves before-and-after balances and supporting evidence. Staff verification and recovery are part of the same account system. Approvers cannot bypass permissions by using a different device.

Responsive website concept. No separate mobile application installation is required. All figures are illustrative.

Roles and permission model

Permissions are enforced on the server for every record and action. A hidden button is not an access control. Users receive only the permissions needed for their work, and access changes are logged.

Action	Admin	Data officer	Approver	Shareholder
Own holding and documents	As authorised	As authorised	As authorised	Own only
Manage shareholder profiles	Yes	Assigned	Review if assigned	Request update
Prepare share movements	Assigned	Yes	Assigned	No
Prepare value updates	Assigned	Yes	Assigned	No
Approve own submission	No	No	No	No
Approve and publish others	If assigned	No	Yes	No
Manage staff and roles	Yes	No	No	No
Company reports and exports	Assigned	Assigned	Assigned	Own statement
Audit history	Yes	Assigned	Yes	No

Recommended separation of duties

Administrative rights do not automatically allow self-approval. A named approver reviews financial changes prepared by someone else. If the client needs a single-operator exception, that policy must be agreed explicitly and separately logged.

Account lifecycle

Create verified profile, issue expiring invitation, activate account, assign role, periodically review access, then suspend or deactivate when required. Suspended users lose active sessions. Staff never retrieve or display another user’s password.

Deletion rules

Unused draft profiles without linked records can be deleted with confirmation. Published financial records and linked identities are retained or archived under the agreed retention policy. Mistakes are corrected through traceable entries; an administrator does not erase the financial history.

Manual updates and publication rules

The system distinguishes the effective business date from the time staff entered or published a record. This supports clear history and makes delayed or future updates understandable.

Stage	Who acts	System behaviour
Draft	Authorised officer	Enter fields, attach evidence and preview the effect
Submitted	Authorised officer	Lock review version and notify approvers in-app
Returned or rejected	Approver	Require a reason; returned records may be revised
Approved	Independent approver	Record approval against the exact reviewed version
Scheduled	System	Hold future-effective changes until their due time
Published	System or permitted publisher	Post atomically after final checks and update visible figures
Corrected	Officer and approver	Post linked reversal or adjustment; retain original history

Prevent conflicting updates

Each save checks the record version. If another person has changed it, staff must reload and compare before resubmitting. Final posting repeats balance and register checks. Transfers either post both sides or neither side, and repeated requests must not duplicate a transaction.

Backdated and scheduled records

Backdated entries require a reason and approval, and affected historical balances and reports are recalculated consistently. Scheduled changes show approval status separately from publication status. Future values must never leak into current shareholder views.

Valuation controls

Values are unique by company, share class and effective time under the agreed policy. Invalid or missing currency, duplicate dates and unsupported values are rejected. Material changes are highlighted for review; client-approved thresholds are configurable.

Data structure and integrity

The proposed database maintains a ledger of movements and versioned valuations. Dashboard balances and graphs are derived from those records, rather than independently edited numbers that can drift apart.

Record	Key information
Company and share class	Identity, base currency, issued totals, class rights reference
Account and role	User ID, status, authentication identity and scoped permissions
Shareholder	Unique holder ID, verified contact details and linked login
Share movement	Reference, type, class, quantity, effective date, affected holders
Valuation version	Amount, currency, class, effective date, basis and approval status
Review and publication	Submitted version, reviewer, comments and posting timestamps
Documents and notices	Owner or audience, version, access rules and publication date
Audit and support	Actor and action history; query reference, owner and status

Reconciliation rules

Published holdings cannot become negative. Transfers do not change total issued shares. New issues and cancellations update company totals through their own approved transactions. Sum of allocated holdings must reconcile to the issued register, including any explicitly recorded treasury or unallocated balance agreed by the client.

Precision and historical consistency

Monetary values use decimal arithmetic with agreed display and rounding rules. Whole share units are assumed unless fractional ownership is explicitly required. A dated statement records its calculation basis, generation time and version. Zero issued shares produce an unavailable ownership percentage rather than division by zero.

Initial import

The client supplies a clean opening register and available history. We map columns, identify duplicates, validate totals and produce a reconciliation preview in a test environment. Named client staff approve the import before production publication. Advanced recurring bulk imports are optional.

Security and operational design

Security is part of the proposed implementation and acceptance process. The controls below are design commitments to verify during delivery, rather than claims about an application that already exists.

Authentication and authorisation

Use a maintained authentication framework or managed identity service, secure password hashing where locally managed, short-lived reset tokens, sign-in rate limiting and multi-factor verification for staff. Shareholder multi-factor verification can be enabled according to the agreed account policy. Every API request checks role, company scope and record ownership.

Private records and files

Use encrypted transport, secure session cookies, server-side input validation and protected storage. Private files are served only after access checks or through short-lived authorised links. Upload limits and file-type checks are applied, with malware scanning configured where supported. Passwords, tokens and verification codes are excluded from logs.

Environments and deployment

Separate development, test and production environments. Keep credentials outside source code. Apply reviewed database migrations and a documented deployment and rollback procedure. Production uses the approved client domain with HTTPS, monitoring and operational alert recipients.

Backups and recovery

Proposed baseline: daily encrypted backups, a 30-day rolling retention window and a restore check before launch. Recovery point and recovery time targets, backup location and incident responsibilities must be agreed against the chosen hosting plan. No availability percentage is promised before hosting and support terms are confirmed.

Data ownership and retention

The client owns its shareholder information and decides who may access it. Retention periods, export handling, deletion requests and jurisdiction-specific requirements must be confirmed with the client’s responsible advisers before launch. This proposal does not claim regulatory certification.

Testing and acceptance criteria

Client acceptance will use realistic sample accounts and an agreed test dataset. The checks below connect the business requirements directly to observable behaviour.

Scenario	Acceptance outcome
Shareholder privacy	SH-001 cannot access SH-002 records through pages, direct links, APIs or file URLs
Sample calculation	12,500 shares at LKR 125 displays LKR 1,562,500 and 1.25% of 1,000,000 issued
Unpublished value	Draft or future LKR 128 remains hidden from current shareholder views
Valid transfer	500 shares move between two holders; issued total remains unchanged
Invalid transfer	Insufficient balance prevents posting and changes neither holder
Approval separation	Submitter cannot approve their own financial update
Concurrent editing	Stale edits are detected; duplicate posting is prevented
History and statements	As-at balances use applicable dates and agree with the register
Account deactivation	Access and sessions are revoked; financial history remains intact
Responsive access	Key flows work on agreed desktop, tablet and phone sizes
Failure and recovery	Errors preserve safe input; backup restore is demonstrated
Audit completeness	Financial changes, access administration and exports are attributable

Client review and sign off

The client reviews interface designs, then completes user acceptance testing in the test environment. Defects against agreed scope are corrected before sign off. New capabilities are assessed through change control. Performance targets are set after shareholder counts, expected concurrency and document sizes are supplied.

Delivery plan and handover

Indicative delivery is 8 to 10 working weeks after scope confirmation, receipt of required data and timely client feedback. This is a planning estimate, not a committed completion date. Some tasks can overlap once their dependencies are complete.

Phase	Indicative duration	Review output
Discovery and scope	Week 1	Data rules, user roles and agreed requirements
Interface design	Weeks 2 to 3	Desktop and mobile designs for client approval
Core development	Weeks 3 to 6	Accounts, ledger, valuations and approval workflow
Portal and reporting	Weeks 5 to 7	Dashboards, documents, notices and statements
Testing and import rehearsal	Weeks 7 to 8	Reconciliation evidence and security checks
Client testing and launch	Weeks 9 to 10	Acceptance, approved import, training and go live

Client responsibilities

Provide branding, approved company details, source data, share rights and valuation rules; nominate decision makers and approvers; arrange access to domain and hosting accounts; review designs and test results; approve production data and publication permissions.

Proposed handover package

Responsive web application, deployed production environment, configured roles, approved initial data, administrator and shareholder guidance, training session, backup and restore instructions, and deployment documentation. Source code access, repository ownership and third-party licences will be specified in the signed agreement.

Support and change control

Proposed defect correction period: 30 calendar days after acceptance, subject to contract. Ongoing maintenance, hosting, monitoring and enhancements are separately priced. A change request records the requested change, cost, timeline and approval before work starts.

Commercial schedule and scope confirmation

No development price, hosting cost or binding payment schedule has been supplied. The schedule below keeps the proposal reviewable without inventing commercial commitments. Amounts, currency, taxes and validity period must be completed before the proposal becomes an offer.

Cost item	Amount	Commercial basis
Discovery and interface design	To be quoted	One-time project fee
Core application and reports	To be quoted	Agreed functional scope
Initial import and training	To be quoted	Agreed source files and sessions
Domain and hosting	To be quoted	Recurring provider charges
Maintenance and support	Optional quote	Agreed coverage and response times
Optional integrations	Separate quote	Only if explicitly selected

Suggested payment milestones

For discussion only: 30% on signed scope and commencement; 30% after interface approval and core build demonstration; 30% after client acceptance; 10% at production handover. These percentages are a suggested structure and require agreement.

Items to confirm before contracting

Client legal name and authorised signatory; developer legal name; supported share classes and currency; scope and optional modules; approved design; data migration boundary; delivery dependencies; pricing and taxes; hosting ownership; intellectual property; confidentiality; support terms and acceptance procedure.
